After the entrance of the United States into the war the Salvation Army began to actively participate in it, doing relief work, etc., among the American troops at home and in France, and among the troops of the Allies. In the United States the war work was carried on by 152 officers and employees, 2 chaplains, 17 hutments, 12 ambulances, 26 rest and reading rooms. There were also 190 War Service League Chapters in operation. These are affiliated with the Red Cross. The statistics for the international war work include 637 officers and employees, 38 chaplains, 155 hutments, 32 ambulances, 200 rest and reading rooms, 15 naval and military homes, and 68 hostels.

**SALZBURG.** A crownland of Austria. Area, 2762 square miles. Population at census of December 1, 1910, 214,737 (0.75 per cent of the Austrian total). Austrian subjects in 1910, 208,562; of these, German, 99.73 per cent. Catholics formed 98.47 per cent of the population. The capital is Salzburg (population in 1910, 36,188). The crownland has a diet of thirty-nine members and is represented by seven members in the Austrian Reichsrat.

**SAMOA.** A group of islands in the Pacific Ocean about 14° S. The islands east of 171° E. belong to the United States; those west of that meridian, to Germany. Area of the German islands, about 994 square miles; population, about 40,000. Area of the American islands, 77 square miles. The most important of the American islands is Tutuila, with an area of 55-square miles and a population (February 1, 1912) of 7251; the other American islands have about 1800 inhabitants. Pago-Pago, in Tutuila, is the most valuable harbor in the South Seas and an important naval station. See GERMAN SAMOA.

**SAMOS.** One of the Anatolian islands. Formerly it was a principality, autonomous, but tributary to the porte in the annual sum of 200,000 piasters. In March, 1913, the island was occupied by Greek troops, and from that time administered through a Greek prefect. The area is stated at 468 kilometres (181 square miles). Recent population figures were not available, but in 1902 the inhabitants, who are mostly Orthodox, numbered 53,424, exclusive of some 15,000 natives of Samos living on the Anatolian mainland. The capital is Vathy, with about 8000 inhabitants.

**SAMPLE FAIRS.** See EXPOSITIONS.

**SANBORN, FRANKLIN BENJAMIN.** An American journalist, humanitarian, and author, died in Westfield, N. J., February 24, 1917. Of an old colonial family, he was born at Hampton Falls, N. H., in 1831, and was educated at Phillips Academy, Exeter, and at Harvard, where he graduated in 1855. Until 1863 he had charge of a school at Concord, Mass., which Ralph Waldo Emerson had asked him to take. During part of this time he was active as an Abolitionist, serving on the Massachusetts State Kansas Committee and ardently supporting John

Brown. He helped to operate the "underground railroad" by which slaves were enabled to reach Canada and was suspected of complicity in the raid on Harper's Ferry in 1859. The next year he was saved by neighbors from the hands of five men, one a Boston constable, after he had refused to go to Washington to testify regarding slave raids. From 1863 to 1867 he edited the *Boston Commonwealth*, and thereafter till 1914 was contributing editor of the *Springfield Republican*, to which he sent a weekly letter up to the time of his death. His zeal on behalf of the unfortunate and oppressed was recognized by Governor Andrew, who, as early as 1863 appointed Mr. Sanborn secretary of the first State Board of Charities in the United States. Of this board he was chairman in 1874-76, and he was State inspector of charities from 1879 to 1888. He helped to found the American Social Science Association, the National Prison Association, the National Conference of Charities, the Clarke School for the Deaf, the Massachusetts Infant Asylum, and the Concord School of Philosophy, and at one time or another he was president or secretary of most of these. He lectured in the School of Philosophy at Concord, where he made his home, and also at Cornell, Smith, and Wellesley. Mr. Sanborn was an authority on Thoreau, wrote several books on him, the last of which was *Final Life of Thoreau* (1915), and edited five volumes of his manuscript. He wrote also biographies of John Brown, Dr. S. G. Howe, Alcott, Emerson, and Dr. Earle; a history of New Hampshire, and *Recollections of Seventy Years*, besides contributing to the *Proceedings* of the Massachusetts Historical Society and editing letters of Paul Jones, J. H. Payne, Mrs. Shelley, and Thomas Love Peacock. Consult his writings and O. G. Villard's *John Brown*.

**SANITATION.** See articles, GARBAGE AND REFUSE DISPOSAL; SEWERAGE AND SEWAGE TREATMENT; WATER WORKS. The Bibliography in this field included: Whipple, *State Sanitation* (Cambridge, Mass.), a review of the work of the Massachusetts State Board of Health for half a century, with reprints and abstracts of scores of special papers and reports; and Wood, *Sanitation Practically Applied*.

**SANTO DOMINGO.** The capital of the Dominican Republic. The name "Santa Domingo" is often used for the country itself. See DOMINICAN REPUBLIC.

**SÃO THOMÉ AND PRINCE.** Two islands off the coast of French Equatorial Africa, in the Gulf of Guinea, near the equator, and about 125 miles off the coast of Africa. They were discovered in 1471 and now constitute a province of the republic of Portugal, under the administration of a governor, who resides in the city of São Thomé. Area, 939 square kilometres (363 square miles); population estimated to be 68,220, consisting of natives, 23,650; contract laborers, 35,535; child workers, 6985; Europeans, 2000; Chinese, 50. Cacao is the principal product of the islands, their output constituting a large part of the world's supply.

Nearly all the work of the cacao plantations is done by contract labor. The wages paid are very small, about 3.60 escudos a month (escudo = \$1.08 at par). Laborers are contracted for in Angola and other near-by African states. The area devoted to cacao trees in the two islands approximates 125,000 acres. The average pro-

duction per tree is 2.2 pounds, and a tree yields for twenty years before it must be replaced. The average production per acre is 250 pounds. During the five years from 1912 to 1916 the annual production was as follows: 1912, 497,329 sacks; 1913, 535,808 sacks; 1914, 569,422 sacks; 1915, 471,024 sacks; and 1916, 629,450 sacks (sack weighs from 132 to 140 pounds). In 1916 shipments of cacao from São Thomé to Lisbon totaled 582,678 sacks, from Principe to Lisbon, 31,704 sacks, from São Thomé to Funchal, 12,318 sacks, and from Principe to Funchal 2750 sacks.

Total imports in 1915, 4,190,780 escudos; exports, 6,268,619. Revenue in 1916-17, 1,415,816 escudos; expenditure, 1,415,816.

**SARAWAK.** The northwestern portion of the island of Borneo; a British protectorate. The area is about 42,000 square miles; population, about 500,000—no census has ever been taken. The capital is Kuching (25,000 inhabitants); Sibu has a large Chinese population, mostly traders, and the Rejang River has a raft population of some 90,000. Chinese are employed in the gold mines of Paku and the Batang Lupar Residency.

Rajah, Sir Charles Johnson Brooke (born 1829); acting, Charles Vyner Brooke (Rajah Muda), the heir (born 1874).

**SASKATCHEWAN.** One of the Prairie Provinces of Canada. It is situated between Alberta, on the west, and Manitoba, on the east, and extends from Montana and North Dakota, at 49° N., to the Northwest Territories, at 60° N. It is separated from Alberta by the meridian of 110° W. Capital, Regina. The estimated area is 251,700 square miles, of which 8318 water. At the census of June 1, 1916, the population was 647,835 (363,787 males, 284,048 females), as compared with 492,432 in 1911, 257,763 in 1906, and 91,279 in 1901. Population of the cities and larger towns June 1, 1916: Regina, 26,127; Saskatoon, 21,048; Moosejaw, 16,934; Prince Albert, 6436; Swift Current, 3181; North Battleford, 3145; Weyburn, 3050; Yorkton, 3144; Estevan, 2140; Melville, 2100.

The provincial government is administered by a lieutenant-governor, appointed for five years by the governor-general of Canada; he acts through an executive council, or responsible ministry. The legislative power is exercised by an assembly of fifty-four members elected for five years. An act of 1917 extends the suffrage to women in provincial and municipal elections. In the House of Commons of the Thirteenth Canadian Parliament, elected December 17, 1917, Saskatchewan has sixteen members. The lieutenant-governor in 1917 was Richard Stuart Lake, appointed October 6, 1915, in succession to George W. Brown. Premier, W. M. Martin. See CANADA.

**SATTERLEE, FRANCIS LE ROY.** A widely known specialist in gout and rheumatism. He graduated from the New York University in 1865 and the medical school of the same institution three years later. He was professor of physics, chemistry, and metallurgy at the New York College of Dentistry for fifty years, retiring as emeritus professor several months ago. He was the author of a treatise on rheumatism and works on gout which were used as textbooks in medical colleges. He was an honorary member of the Society of Arts, London, a Fellow of the Academy of Medicine, and a member of the American Medical Association, and the

Pathological Society. He was seventy years old and died in New York City on November 12, 1917.

**SAULT STE MARIE CANALS.** See CANALS.

**SAVINGS BANKS.** There are two general classes of savings banks, commercial and government or postal. Commercial savings banks in the United States are divided into two classes, mutual and stock. The mutual banks are found almost exclusively in New England and the Eastern States, while the stock savings banks are numerous throughout the Middle West and South. On June 30, 1917, according to the report of the Comptroller of the Currency, there were 1807 mutual and stock savings banks in operation in the United States, exclusive of the stock savings banks in the States enumerated in the article STATE BANKS (q.v.). These did not, of course, include the savings department which during the last few years had been very extensively established by national banks and trust companies.

There were 622 mutual savings banks with aggregate resources of \$4,811,000,000, including loans and discounts of \$2,368,401,000, and bonds and other securities valued at \$2,131,688,000. Their liabilities comprised surplus of \$321,793,000 and individual deposits of \$4,422,489,000. The 1185 stock savings banks had total resources of \$1,127,893,000, of which \$763,770,000 were in loans and discounts and \$159,480,000 in bonds and other securities. Their deposits equaled \$995,532,000; their capital \$69,170,000; and their surplus \$30,585,000.

**POSTAL SAVINGS BANKS.** The Federal Postal Savings System established in 1911 has grown rapidly. Accounts may be opened by any one ten years of age; no one may have more than one account; the accounts of married women may not be drawn upon by their husbands; and amounts of deposits may not be disclosed by post-office employees. Deposits bear 2 per cent a year, but no interest is paid for less than a full year. Deposits may be exchanged for registered or coupon United States postal savings bonds, bearing interest at 2½ per cent. in denominations of \$20, \$100, and \$500. The postal savings funds are deposited in approved banks giving interest of not less than 2¼ per cent; funds are when possible deposited in local banks. There were no changes in the Postal Savings Law in 1917.

On June 30, 1917, there were 674,728 depositors on the books of the system with \$131,954,000 to their credit. This was an average deposit of \$195.57. During this year there was an increase of nearly 12 per cent in the number of depositors, of over 53 per cent in the amount of deposits, and of over 37 per cent in the average balance per depositor. There were in all 7161 depositories, including 6423 post offices and 738 branches and stations. The funds were deposited in 5583 banks, including 3486 national banks, 1274 State banks, 242 savings banks, 568 trust companies, and 13 private banks. The ten States having the largest number of depositors and the amount standing to their credit were as follows: New York, 239,475, \$40,925,953; Pennsylvania, 58,882, \$13,693,951; Illinois, 40,204, \$9,265,211; Ohio, 39,347, \$8,943,607; Massachusetts, 33,012, \$5,621,535; New Jersey, 27,628, \$4,716,871; California, 23,755, \$4,727,383; Michigan, 23,609, \$5,821,425; Connecticut, 19,173, \$3,606,098; and Washington, 17,258, \$4,100,664.

The fifteen offices with the largest deposits on September 30, 1917, and amounts of deposit in them were as follows: New York, \$29,764,908; Brooklyn, \$9,536,745; Chicago, \$6,988,704; Detroit, \$4,207,184; Boston, \$3,011,264; Pittsburgh, \$2,714,794; Cleveland, \$1,885,022; Philadelphia, \$1,741,985; Portland, Ore., \$1,625,750; Milwaukee, \$1,514,964; San Francisco, \$1,382,151; Newark, \$1,349,413; Seattle, \$1,328,457; St. Louis, \$1,293,435; Toledo, \$1,189,310.

Postal savings bonds were issued in exchange for deposits during the fiscal year to the amount of \$1,606,760. Over 92 per cent of these bonds were in the registered form, indicating permanent investment. Interest on postal savings funds together with small miscellaneous receipts amounted to \$2,703,000; interest paid to depositors, \$1,274,000; losses due to fire, burglaries, etc., \$3577; excess of interest received over interest paid and losses, \$1,475,000.

Postal savings facilities were extended to Alaska in 1916, when eight offices were made available; in 1917 four additional offices were opened. Total deposits in Alaska on June 30, were \$332,947. The average deposit in Alaska was \$407, being the highest in any State or Territory. During the year a publicity campaign was conducted to bring the benefits of the system to the attention of all classes of the population. Circulars were printed in English and twenty-four foreign languages; and millions of post cards setting forth the principal facts were sent directly through post office channels.

**SAVING STAMPS.** See FINANCIAL REVIEW.

**SAXONY.** A European kingdom; also a grand duchy and a Prussian province. The kingdom of Saxony is one of the more important constituent states of the German Empire. Its capital is Dresden. The kingdom has an area of 5789 square miles, which is somewhat smaller than the combined land area of Connecticut and Rhode Island. Its population increased from 1,194,000 in 1816 to 2,337,000 in 1864, 4,202,216 in 1900, and 4,806,661 in 1910 (census of December 1). The average annual increase from 1816 to 1910 was 1.48 per cent; from 1900 to 1910, 1.53 per cent. In 1910, communes having 2000 inhabitants or more aggregated a population of 3,507,414. Evangelicals numbered 4,520,835 (94.05 per cent) in 1910; Roman Catholics, 236,052 (4.91 per cent); other Christians, 25,574 (0.53 per cent); Jews, 17,587 (0.37 per cent). Saxony has a bicameral parliament. The king in 1917 was Friedrich August III, who was born May 25, 1865, and succeeded his father, King Georg, October 15, 1904.

The grand duchy of Saxony, or Saxe-Weimar, is a constituent state of the German Empire. Capital, Weimar. Area, 1394 square miles. Population at the 1910 census, 417,149, as compared with 362,873 in 1900 and 280,000 in 1864. In 1910, 94.40 per cent of the population was Evangelical, and 4.79 per cent Roman Catholic.

The Prussian province of Saxony has an area of 9756 square miles. Population in 1910, 3,089,275, as compared with 2,832,616 in 1900 and 2045 in 1864. In 1910, 91.61 per cent of the population was Evangelical, and 7.53 per cent Roman Catholic. The capital is Magdeburg.

**SCANDINAVIAN LITERATURE.** The interest in the war mentioned in the preceding YEAR BOOK was less evident in 1917; fewer works dealt directly with it or with problems

relating to it, but we can see indirectly its effects on the literature of the year. The reflective mood was becoming slightly more apparent, and there was a prevalence of problems—particularly the social problem—as themes.

**DANISH. Drama.** Helge Rode's *Det store Forlis* (*The Great Wreck*) takes its name from the wreckage of life in the pursuit of power and honor. It reminds us of Tolstoy's *The Living Corpse*. In O. Münster's *Højere Magter* (*Higher Powers*), a problem play of the old type, the mutual love of father and daughter triumphs over their religious differences.

**Fiction.** Danish literature suffered a great loss by the death of Jakob Knudsen. In *Guds Venner* (*God's Friends*), Karl Gjellerup returns to the old time novelistic technic with its intrigues and involved situations. The author is particularly successful in depicting pathos. Gunnar Gunnarsson's new Icelandic story, *Varg i Yeum* (*The Wolf in the Sanctuary*) is alive with local atmosphere, but not as strong as his other works. In *Clara van Haags Mirakler* (*The Miracles of Clara van Haag*) Johannes Buchholtz proves himself a master both of humor and pathos, but the book fails to make the impression of an organized whole. Henrik Pontoppidan's *Faustingholm* is the last of the series *The Kingdom of the Dead*, which began with *Torben* and *Jytte*. It depicts the struggle of church and state to wrest away from the people of the twentieth century the liberty which its leaders gained for them in the nineteenth. Kristian Jensen's *Riget* (*The Kingdom*) and Thit Jensen's *Jyske Historier* (*Jutland Stories*) are collections of short stories from Jutland life.

**Science, Literature, etc.** Otto Jespersen's *Nutidsprog hos Børn og Voksne* (*Contemporary Speech Among Children and Adults*) is of special interest because of the light it throws on child speech. Carl Lassen's book about *Frøding* is a good introduction to that author.

**NORWEGIAN. Poetry.** *Himmelvarden* (*The Heavenly Lighthouse*), a cycle of poems in Landsvaal by Olav Aukrust, touches the theme of Goethe's *Faust*—the striving upward. As Goethe praises action so Aukrust praises will. Bjørnson's verse romance *Arnljot Gelline* was translated into English by William Morton Payne.

**Fiction.** In John Bojer's *Den store hunger* (*The Great Hunger*) we notice the influence of Bergsonian philosophy and recent French literature. It is full of optimism and expresses the author's conviction that man's will for good is all powerful. Harry Sjøberg's *Foran livets port* (*Before Life's Gate*), depicting peasant life, combines certain romantic features with that careful portrayal of men and nature characteristic of the realistic school. Barbra Ring's *Under sejl* (*Under Sail*) is centred around a woman who by her envy and selfishness makes life unhappy for herself and others. In Katharina Gjesdahl's *Den store avgjørelsen* (*The Great Settling*) the memory of former loves all but separates husband and wife. *Det gode samvite* (*The Good Conscience*) by Olav Duun is a realistic story of peasant life.

**Science, Literature, etc.** Francis Bull's *Fra Holberg til Nordal Brun* (*From Holberg to Nordal Brun*) treating Norwegian intellectual life from 1750 to 1770 is practically a continuation of the author's earlier work *Ludvig Holberg as an Historian*. In Konrad Limonsen's *Den*

*moderne mennesketype* (*The Human Type of Today*) we see the influence of Walther Rathenau. The author contends that the present generation is too much bent on mastering the externals and neglecting the deepening of the intellectual and spiritual life.

**SWEDISH. Poetry.** In his collection *Sommarnatten* (*The Summer Night*) Arvid Mörner interprets the life of the peasants and the fishermen. The poet shows a strong love for the places and the people he portrays. In Bo Bergman's *Elden* (*The Fire*) we feel that the melancholy expressed comes directly from the author's own heart. Also of a subjective character are Jacob Tegnengren's *Dikter* (*Poems*), a seventh collection, lyrics touching nature and love. Bertil Malmberg translated a number of Schiller's poems, his own works, also, *Atlantis* and *En blödande jord* (*A Bleeding Earth*) show strong influence of the German poet, particularly his idealism of English translations. Charles Wharton Stork's *Anthology of Swedish Lyrics* is particularly deserving of mention.

**Fiction.** One of the favorite subjects of novels for the year was the old time manor with all its lore and traditions. It is the manor itself rather than any single individual that is the hero. *Brovallahans* by Biger Mörner extends over a period of three hundred years, while Hedvig Svedenborg's *Ulfveggråden* covers a comparatively short period, only giving us fragments now and then of some of the earlier history. Among stories with a sociological tendency we may mention Ture Janson's *De ensamma svenskarna* (*The Lonely Swedes*), an arraignment of the upper class for their indifference toward the working men, and Martin Koch's *Guds vackra värld* (*God's Beautiful World*), which depicts with accuracy and sympathy the life of the poor and criminal class in Stockholm. Juhani Aho's *Fredseremiten* (*The Peace Hermit*) is a strong plea for world peace. Friends of Peace gather around the hero from several countries, but when war is declared they fall into two hostile groups, thus causing the hermit to despair of his peace idea. He soon, however, regains his faith, thinking that if one individual believes in universal peace, it must come. Of great interest to the English reader is the translation of Selma Lagerlöf's works.

**Science, Literature, etc.** Albert Nilsson's *Svensk romantik* (*Swedish Romanticism*) shows the prevalence of Platonic Philosophy in a number of romantic writers. John Landquist's *Gustaf Fröding* devotes a great deal of space to Fröding's insanity and its influence on his literary activity. Martin Lamm's *Svedenborg* traces the growth of Swedenborg's philosophical and religious ideas, showing how the latter directly grew out of the former.

**SCHILLER, FRIEDRICH.** See MUSIC, *Orchestras*.

**SCHOOLS.** See EDUCATION.

**SCOTLAND.** A division of the United Kingdom, forming the northern part of the island of Great Britain, with adjacent isles. The area is 30,405 square miles; land area, 29,796 square miles, which is slightly smaller than the land area of the State of Maine. Population, 4,760,904, according to the 1911 census; 1915 estimate (subject to revision), 4,785,598. See GREAT BRITAIN.

**SCULPTURE.** See PAINTING AND SCULPTURE.

**SEALS.** See ALASKA; FISH AND FISHERIES.

**SEA PLANES.** See NAVAL PROGRESS; AERONAUTICS.

**SEED.** See AGRICULTURE.

**SEISMOLOGY.** See EARTHQUAKES.

**SELANGOR.** A state on the western coast of the Malay Peninsula; one of the Federated Malay States (q.v.).

**SELECTION.** See ZOÖLOGY.

**SELECTIVE DRAFT.** See MILITARY PROGRESS; UNITED STATES AND THE WAR.

**SELIGMAN, ISAAC NEWTON.** A prominent banker in New York City. He was born in New York City on July 10, 1855, and was killed by a fall from his horse on September 30, 1917. He was graduated from Columbia University in 1876. While at this institution he was prominent as an athlete and student. He immediately entered the banking firm of his father and rose to be one of the foremost bankers in the Wall Street district. He was widely interested in charities, and was a trustee of many charitable institutions as well as financial organizations. At the outbreak of the war he opposed the formation of Jewish regiments on the grounds that a Jew should be a Jew only in religion, and an American in all else.

**SELOUS, FREDERICK COURTENEY.** A British hunter, explorer, and soldier, killed when leading an attack on Bhoheho, German East Africa, January 4, 1917. He was famous for his adventures and for his understanding of the African natives. H. Rider Haggard took him as the prototype of Allan Quatermain in *King Solomon's Mines*, *She*, and other stories where the hero's experiences were closely patterned on those of the intrepid explorer. Selous had English, Scotch, and French blood in his veins, and on his mother's side traced descent from Robert Bruce. He was born in London in 1851 and after attending Rugby was sent for further studies to Neuchâtel, Switzerland, and then to Wiesbaden, Germany. At twenty he went to South Africa, thence to Matabeleland, and for eighteen years he was virtually buried in the dark continent, traveling and hunting. He made a notable collection of natural history specimens, flora and fauna, which were sent to the British Museum. In 1890, for the British South Africa Company, he accompanied the pioneer expedition to Mashonaland as guide, a service for which his knowledge of the people and country eminently fitted him. With short visits in England between enterprises, he participated in the first Matabele War in 1893 and in a later native insurrection. His rank was that of captain of Royal Fusiliers. Although sixty-three years old at the outbreak of the European War he volunteered for service with the Legion of Frontiersmen, a Boer organization (he had always been a warm supporter of the Boers), and in 1916 received the Distinguished Service Order for gallantry. Captain Selous helped to outfit Colonel Roosevelt for his African hunting trip, and accompanied him on part of it. From the Royal Geographical Society he received the Outhbert Peek grant, the Back premium, and the Founder's gold medal. He had a home in Surrey, England. It was reported that before he received the fatal wound in his last engagement, he had already been hit once but continued to encourage his men. Selous wrote: *A Hunter's Wanderings in Africa; Travel and Adventure in South East Africa; Sunshine and Storm in Rhodesia; Sport and Travel, East and West; Recent Hunting Trips in*

*British North America; African Nature Notes and Reminiscences.*

**SEMBRIQH, MARCELLA.** See MUSIC, Artists, Vocalists.

**SENATE.** See UNITED STATES AND THE WAR.

**SENEGAL.** One of the constituent colonies of the government-general of French West Africa (q.v.). The capital is Saint Louis.

**SERBIA.** A kingdom of eastern Europe, divided from Hungary by the Danube and the Save, and bordered by Bulgaria on the east, by Albania and Montenegro on the west, and by Greece on the south; one of the Balkan states. Belgrade (Biograd, the "white fortress") is the capital. Serbia, for the present a lost nation, served as the match in the fingers of Germany and Austria-Hungary for the lighting of the European conflagration. When Belgrade was occupied by Austro-German troops (October 9, 1915) and Usküb by the Bulgarians (October 22), after Kragujevats, Nish, Prizrend, and Monastir had fallen (November-December) the Serbian government was removed to Corfu.

**AREA AND POPULATION.** The table below shows area by departments, population according to the census of December 31, 1910, population as calculated December 31, 1911, and density (1911) per square kilometre:

Department	Sq. km.	1910	1911	D.
Belgrade*	12	89,878	92,288	123
Belgrade	2,025	155,815	158,378	
Kragujevats	2,295	189,025	192,124	84
Krajina	2,909	112,142	118,128	39
Krushevat	2,710	167,371	170,853	63
Morava	2,900	203,688	206,547	71
Nish	2,558	198,768	201,762	79
Uzhitze	8,288	146,768	149,115	45
Pirot	2,419	112,814	114,115	47
Podrinje	8,851	238,275	242,029	68
Pozharevats	4,157	259,906	262,208	63
Rudnik	1,569	85,340	87,187	56
Smederivo	1,277	143,216	144,829	119
Chechak	8,798	188,911	141,267	37
Timok	3,196	149,588	150,965	47
Toplitsa	2,839	110,218	112,610	40
Valjevo	2,459	158,648	160,873	65
Vranja	4,342	252,937	257,087	59

\* City. † 18,650 square miles.

According to religions the censused population was divided into Greek Catholics, 2,881,220; Roman Catholics, 8435; Mohammedans, 14,335; Jews, 5997; Protestants, 799; and other religions, 915. Belgrade had 90,890 inhabitants; Nish, 24,949; Kragujevats, 18,452; Lescovats, 14,266; Pozharevats, 13,411; Vranja, 11,439; Pirot, 10,737. Bitolj (Monastir) had in 1910 a population of 59,856; Skoplje (Usküb), 47,384; Prilip (Perlepe), 21,733; Prizrend, 21,244; Prishtina, 18,174.

By the terms of the treaty of Bucharest (July 25, 1913), Serbia gained, as a result of the wars in the Balkans, the eastern part of Novibazar, Kossovo, and Central Macedonia. The new territories have an area estimated at 39,000 square kilometres, and are composed of the following territories: Bitolj, with 345,759 inhabitants; Ishtib, unknown; Debar, 82,476; Kavadar, 97,763; Kumanovo, 166,939; Novibazar, 133,401; Plevlje, 62,601; Prishtina, 239,386; Prizrend, 227,425; Skoplje (Usküb), 153,293; Tetovo, 157,249.

**NATURAL RESOURCES; PRESENT CONDITIONS.** It would be idle to republish old statistics for production, commerce, and so forth. These may

be found in previous YEAR BOOKS and will give a clear idea of the former relative European importance of this stricken nation.

The most fertile and densely populated among the Balkan states, Serbia is essentially an agricultural country, and stock raising has been the most important occupation of the people. Tilled fields alternate with oak-covered hills which maintain great herds of swine. Of the total area 1,865,392 hectares were under cultivation, and 1,546,000 under forests. Cereals, plums in large quantities, and vines were grown. There were 965,208 cattle in the country, at the last live stock census, 3,808,815 sheep, 152,617 horses, 836,544 swine, and 627,427 goats. The mineral resources include coal and lignite, copper ore, and gold. According to the *Deutsche Balkan Zeitung*, of Sofia, an expert who had been looking over the Serbian coal fields to find opportunities for investment, declared that hard and soft coal and lignite are found in great abundance. There were but 14 mines operating in 1910. The number had increased in 1914 to 22, but because of lack of miners, machinery, enterprise, and capital no further development seems to have taken place. The expert referred to in the *Zeitung* found 10 other localities in which mines could be successfully operated, besides a rich field of coal near Usce, along the bed of the river Iber. Statistics show that the production of soft coal and lignite doubled between 1900 and 1910, 51,320 tons of anthracite coal, 16,622 tons of soft coal, and 7899 tons of lignite having been mined in the latter year. After the occupation of Serbia, all its mines were in the hands of German army engineers who so thoroughly organized the work upon them that it was generally believed the output had been materially increased.

According to advices received in London, February 28, 1917, by the Royal Serbian legation, Austria was doing with the Serbians what Germany had long been doing with the Belgians. A reign of terror was said to prevail in the parts of Serbia under Austria-Hungary. Deportations of Serbians on a large scale had been begun by the Austrian military authorities in the conquered territory. Coöperating with the Austrians were the Bulgarians, and, to a smaller extent, the Germans. During September more than two thousand native Serbians were deported. On the Serbian territory occupied by the Austro-Hungarian authorities, murders were said to have been carried out simply in accordance with a list in which certain anticipated "crimes" entail the death penalty; which list had been drawn up by the military commander-in-chief, the Archduke Frederick, growing longer from day to day, and including an ever-increasing number of offenses punishable by death. By public executions and by exposing the bodies, Austria-Hungary was reported to be endeavoring to intimidate Serbia, and by the removal of its best and most prominent men she was trying to deprive it of all its leaders and advisers. In the months following the deportations grew to alarming proportions. In all, about 60,000 Serbians were said to have been deported. All males above fourteen were exiled by the Teuton-Bulgarian authorities. The exiled Serbians were employed by their enemies in digging trenches and work of similar character. They were often exposed to the fire of their own brothers and Allies. In addition to this, they succumbed in

large numbers to disease and exhaustion, for the conditions under which they were deported and brought to their destination were described as unimaginably inhuman.

The fugitive king is Peter Karageorgevitch, grandson of the celebrated Kara George, and son of Alexander Karageorgevitch, elected king (June 2, 1903 o. s.) under the name Peter I. See WAR OF THE NATIONS; RELIEF FOR WAR VICTIMS.

**SEWERAGE AND SEWAGE TREATMENT.** The outstanding features of the year 1917 were the provision of sewerage facilities for army camps and the continued study of methods of sewage treatment, particularly activated sludge. At the sixteen army cantonments, and at some of the National Guard and other camps, sewerage systems were provided within a few weeks' or months' time to remove the liquid wastes from 30,000 to 40,000 men. Standard plans and specifications were proposed in Washington and then adapted to meet the local conditions at each camp. In the collective systems, commonly accepted practice as to pipe conduits, manholes, etc., was used. Where treatment was necessary, one-story septic tanks of special design were installed. In some cases this was sufficient. In others, secondary treatment was provided, consisting of either intermittent sand or sprinkling filters, or else chlorination for disinfection. Rarely, the three methods named were combined. No treatment whatever was given at thirteen of the thirty-two cantonments and camps. See *Engineering News-Record*, September 15, 1917, for detail drawings of standard septic tank and sprinkling filter and for method of disposal in use at thirty-two camps.

**BROADER SPECIFICATIONS FOR MATERIALS.** After a prolonged struggle between the vitrified clay and cement interests, Los Angeles, Cal., opened its specifications so as to permit the use of concrete sewers. Detroit went still further. For years it had allowed brick only to be used in sewer construction. On recommendation of its engineers, backed by the Detroit Bureau of Governmental Research, the specifications were opened to a variety of other materials, but segmental blocks of vitrified clay and shale were still not permitted.

**SEWAGE TREATMENT.** The most common American practice still was to employ Imhoff tanks (two-story septic tanks) for sedimentation, sprinkling filters for oxidation and chlorination for disinfection, choosing one or a combination of two or of all three processes to suit local conditions. Contact beds or intermittent sand filters were sometimes considered more suitable than sprinkling filters. Fine screens were being introduced to remove a portion of the solids instead of settling tanks of the plain or Imhoff septic type. Such screens were recommended in 1917 for Cleveland, Ohio, and Indianapolis, Ind. They were in use in connection with tanks at Rochester, N. Y., and a number of smaller American cities, and were being installed to treat a small portion of the sewage of New

York City. They were extensively used on the continent of Europe.

**ACTIVATED SLUDGE.** This process of aerating sewage which contains an accumulation of sludge in order to produce clarification, a non-putrefactive effluent, and a reduction of bacteria continued to be studied in the United States and Europe. A few permanent plants were installed in England, Canada, and the United States. During the year the working-scale plants at Milwaukee, Wis., and Cleveland, Ohio, were continued in operation, as well as plants at several localities for the treatment of stockyards sewage. Experimental studies on a smaller scale were being made at Worcester, Mass., New Haven, Conn., Pasadena, Cal., and Moscow, Russia. At the latter place a number of other methods were being studied. At New Haven, the installation included activated sludge, Imhoff tanks, Miles acid tank for the recovery of grease and fertilizer material and disinfection by liquid chlorine. At Syracuse, parallel tests of activated sludge and continuously aerated gravel filters were being made.

Plans for an activated-sludge plant were being drawn at the close of the year for Brockton, Mass. Though there was much still to be learned as to the best method of dewatering the final sludge, the practicability of converting the sludge into fertilizer, and the cost of this method of treatment, yet the activated-sludge process must be considered as full of promise. An extended review of the process at large, and as studied at Milwaukee, Wis., was presented to the American Public Health Association in October by T. Chalkley Hatton, chief engineer of the Milwaukee Sewerage Commission (see *Engineering News-Record*, November 1, 1917, for lengthy abstract).

**SHAW, JOHN BANKS.** An English Wesleyan leader, and theologian, died in March, 1917, at Headingly. He was born in Sheffield in 1835. After receiving his education at Birmingham, he went as a missionary to southern India in 1856 and remained there till 1864. Then, for some sixteen years, he worked in various cities of England and Scotland. For thirty years, till his retirement in 1910, he held a professorship at the University of Leeds. Edinburgh conferred on him the degree of D.D. in 1903, the year after he served as president of the Wesleyan Conference. Dr. Banks made a number of translations of German theological works, and wrote *Manual of Christian Doctrine*, *The Science of Religion* (Fernley Lecture), *Development of Christian Doctrine* (2 vols.), *Tendencies of Modern Theology*, *Central Questions of Faith*, *The New Testament Books*.

**SHEEHAN, WILLIAM FRANCIS.** A noted corporation lawyer and at one time the lieutenant-governor of New York State. He was born in Buffalo, N. Y., on November 6, 1859, and died March 14, 1917. For six terms he was a member of the New York State Assembly and at one time its speaker. In 1891 he became lieutenant-governor, being the youngest man to hold this position in the history of the State. He was educated at St. Joseph's College in Buffalo and was admitted to the New York State Bar in 1880. In 1904 he was the manager of Alton B. Parker, the Democratic candidate, for the

presidency of the United States. In 1911 he made a memorable but unsuccessful fight in the New York State Legislature for the position of United States Senator. He had the statewide Democratic support, but was defeated by an active minority, James A. O'Gorman being the successful compromise candidate.

**SHELL SHOCK.** The true nature of shell shock has been a matter of debate ever since the war began. Dr. Morton Prince, of Boston, as a result of extensive study at the front and in the base hospitals in France and England, voices the consensus of opinion that true shell shock does not differ in any way from the ordinary traumatic neuroses observed in certain individuals after railway accidents, earthquakes, etc. In other words it is nothing but traumatic hysteria, although its manifestations may vary all the way from neurasthenia to profound paralysis and anesthesia. Cases of true shell shock must be differentiated from those of an organic nature due to injury of the brain and spinal cord, resulting from physical injuries, gas poisoning, or the sudden compression and rarefaction of the air during heavy artillery firing. Prince believes that shell shock should be more properly described as "shell fear" or "shell funk," the causative factor being undoubtedly psychic, that is, fear, acting on a mind already prepared by its surroundings for the final results. There is a widespread belief among soldiers that shell shock is due to a physical injury of the brain, resulting from concussion, and that they may be seriously injured in mind and body and may be more or less permanently incapacitated. Many soldiers are consequently in a state of continuous terror during the course of a bombardment by the enemy. In the way of prevention, Prince suggests a more careful elimination of neurasthenic and psychasthenic individuals from troops engaged in actual fighting. Fighting units should be instructed in the nature of the disease and it should be impressed upon soldiers that shell shock is merely a form of hysteria.

**SHIP BILL, ARMED.** See **UNITED STATES AND THE WAR.**

**SHIPBUILDING.** It would be little exaggeration to say that next to the actual raising and providing of food for the inhabitants of the world, the shipping and shipbuilding industries were the most vital both in connection with the war and the well-being of mankind in general, during the year, 1917. Indeed ships were required not only by the belligerents, but also by the neutrals, as an important element in their struggle for existence, not to mention commercial supremacy, and when in 1917 Germany began the unrestricted submarine campaign against British and other Allied shipping, as well as against neutrals that transgressed her arbitrary orders and regulations, even greater interest attached to the matter. During the early period of this unrestricted warfare, from twenty to thirty large ocean-going vessels were sunk by the Germans, and it was said that the war was becoming a race between the Allies in building ships and the Germans in sinking them.

At this time, Great Britain was making great efforts to increase both naval and merchant tonnage, particularly the latter, and to a less

extent shipbuilding was being carried on by France and the other Allies. With the entrance of the United States into the war, shipbuilding, which had been for two years previously an important consideration, now became a vital matter.

**EMERGENCY FLEET CORPORATION.** On April 17, 1917, the Emergency Fleet Corporation was established by the United States government under the provisions of the Shipping Board Act of the previous year. This corporation was charged with the immediate duty of making a large commercial merchant marine of standardized and other ships in the shortest possible space of time and under the most modern ideas of efficiency and economy in working with speed as the primary object. The first contract for new construction was let on April 27, 1917.

Gen. George W. Goethals, U. S. A., builder of the Panama Canal, was made managing director of the Emergency Fleet Corporation, while William Denman was the chairman of the Shipping Board. The work of the Shipping Board and the Emergency Fleet Corporation during the year was involved in prolonged controversy and criticism. There was lack of coöperation between the personnel of the two boards, with the result that a series of changes took place during the year. An early feature of the work was the announcement by Mr. Denman of a shipbuilding programme of 1000 wooden ships. This proposal at once aroused widespread criticism as being impossible of fulfillment and not in accord with modern ideas of shipbuilding or merchant shipping generally. It was argued that there were not enough skilled ship carpenters to build such ships at short notice, that there would be difficulty in getting out the timbers, and even when built they would be far less efficient and economical than steel vessels. Gen. Goethals publicly expressed his doubt of the feasibility of the wholesale wooden ship construction and instituted a comprehensive programme for building steel vessels. In an address on May 25 before the American Iron and Steel Institute, Gen. Goethals stated that he would construct 3,000,000 tons of steel ships in eighteen months, but that in his opinion, the original wooden ship scheme of the Shipping Board was hopeless.

This and other points of difference led to a controversy between Chairman Denman and Gen. Goethals and resulted in the resignations of both at the request of the president. Mr. Denman was succeeded on July 27 as chairman of the Shipping Board by Edward N. Hurley of Chicago, who thus became responsible for the prosecution of the construction plans of the Shipping Board. As general manager of the Emergency Fleet Corporation, Rear Admiral Washington L. Capps, Naval Constructor, U. S. N., succeeded Gen. Goethals.

Besides these shifts in heads, there were numerous changes in the Shipping Board, and John A. Donald of New York remained the only one of the original appointees at the end of the year. Bernard N. Baker of Baltimore, a practical shipping man, early had resigned, and was succeeded by Raymond B. Stevens of New Hampshire. John B. White of Kansas City, Mo., who resigned at the same time as Mr. Denman, was succeeded by Bainbridge Colby of New York, in July. Charles R. Page of San Francisco took the place of Theodore Brent of New Or-

leans. On November 23, Admiral Capps resigned and to his place Rear Admiral Frederick R. Harris, chief of the bureau of yards and docks, U. S. N., was detailed as general manager of the Emergency Fleet Corporation. It was stated that Admiral Capps asked to be relieved on account of physical disability, but there were rumors that he as well as other engineers had found the work uncongenial on account of difficulties inherent to the organization and its personnel. When the organization of the Emergency Fleet Corporation was changed on November 12, a number of engineers were added to the personnel. Charles Piez, president of the Link-Belt Company of Chicago, was made a vice-president of the corporation in charge of the actual construction, and he succeeded as general manager when Admiral Harris asked to be relieved. Mr. Piez was the incumbent of the office at the end of 1917. Under the reorganization James Heyworth, a Chicago contractor, was placed in charge of the wooden ship construction, and Charles Day of Philadelphia was sent to England to study the building of standardized ships in that country. A. J. Meson, a Chicago engineer, was detailed to field supervision of the various yards of the corporation.

Aside from the personal difficulties of the members of the Shipping Board and the Emergency Fleet Corporation and the lack of a decided programme and ability to carry it through, there were many other difficulties involved. At many points and especially on the Pacific Coast, there were numerous strikes, and in September a special wage adjustment board of which V. Everit Macy of New York was chairman, was appointed to deal with the matter, and established a basis of settlement and a method for avoiding future difficulties (see STRIKES). Furthermore, there was a great shortage of efficient and adequate labor, and at or near the new plants that were established, there was a lack of housing facilities so that it was difficult if not impossible to attract labor. The Emergency Fleet Corporation established an Industrial Service Department under the head of Meyer Bloomfield, an industrial engineer, whose function was to supervise a train of workmen for ship construction and also to develop plans for the housing of the workmen. At various centres, courses for instruction in shipbuilding were established and at least a beginning was made towards manning the plants with workmen, although up to the end of the year these were far insufficient in numbers. With the general demand for materials and the shortage of transportation, there was somewhat of an uncertainty as regards securing adequate supplies, although by the standard processes adopted much of the work was done at the steel mills, so that at many of the yards the work consisted merely of fabricating or riveting in proper position the sections and plates previously shaped and punched.

By the end of the year, the Emergency Fleet Corporation had developed an organization of 1000 employees and had established sixteen offices in various parts of the country. There were 1427 vessels being built in 132 shipyards scattered throughout the United States. During the fiscal year ending July 1, 1917, the total tonnage of merchant ships completed in the United States was nearly 800,000 tons. In 1916, there were 66 shipyards in the United States, of which 27 were for the construction of wooden ships, while

by the end of the year, 1917, there were approximately 142 shipyards. The Emergency Fleet Corporation had let contracts during the year to 110 shipyards, of which but 36 existed on January 1, 1917. At the end of 1917, the Emergency Fleet Corporation controlled work at 132 yards, of which 58 were old and 74 new.

**DEVELOPMENT OF SHIPBUILDING.** An indication of the importance of the shipbuilding industry in the United States during 1917 was shown by the extent of the incorporation of shipping and shipbuilding firms. In 1917, firms of this class with capital aggregating \$271,503,000 were incorporated. Prior to 1916, the total shipbuilding capacity of the world, including Germany and Austria, was 3,685,000 tons. The total production of ships in all of the world during 1917 was approximately 3,250,000 registered tons. The United States Shipping Board proposed by the end of 1919 to have constructed a grand total of 14,500,000 deadweight tons, or approximately 9,600,000 registered tons, these figures, however, including not only the new construction but that commandeered and the enemy ships that had been seized. In addition to the merchant shipbuilding of the United States, there was in progress of construction a numerous naval shipbuilding programme totalling 787 ships, of which 150 were to be submarine destroyers, giving to America the largest destroyer fleet in the world, and involving a total cost of \$1,150,400,000.

The Urgency Deficiency Bill, which was approved on June 15, 1917, gave the president adequate power in placing orders for ships and ship materials and to take over for the use of the nation not only the output of the shipyards, but the shipyards themselves, operating them as national plants. The Emergency Fleet Corporation was active during the summer and autumn in awarding a large number of contracts for wooden, composite, and steel ships to firms and yards on the Atlantic, Gulf, and Pacific ports, as well as on the Great Lakes, so that every shipbuilding establishment in the United States had contracts for at least its capacity and even in some cases requiring various extensions. Late in November, the United States Government announced that since the Emergency Fleet Corporation had been formed, contracts had been let for 884 new vessels, aggregating 4,724,300 tons deadweight and that a further output of 426 vessels of 3,029,508 tons had been requisitioned on the ways. At the same time, there were contracts pending for 99 vessels of 610,000 tons.

The Shipping Board announced towards the end of September that the wooden ship programme had progressed 9 per cent, the requisitioned steel ship programme, 39 per cent; the composite ship programme, 20 per cent; and the contract steel programme 4 per cent. In this statement, it was further announced that of the 379 wooden hulls that had been contracted for, keels had been laid for 168, of which 130 were in yards that did not exist when the contracts were let. The wooden hulls were ordered from 72 yards, of which 51 were built from the ground up after the contracts had been let. Of the 58 composite ships contracted for, keels had been laid for 12, the contracts going to 4 shipyards, 3 of which did not exist when the contracts were made, but by the end of the year,

they had been completed and were ready to undertake immediate construction.

Contracts for the steel ships were awarded to 32 yards, of which 20 were new, and 11 keels for steel ships had been laid in new yards. Four ships had been launched during the year, 2 of steel and 2 of wood, while of those requisitioned, 49 had been launched and completed.

The first of the vessels which had been contracted for by the Emergency Fleet Corporation was launched on November 24 at Seattle at the yards of the Skinner and Eddy Corporation, and during the year 1918 it was expected by the Shipping Board that 5,000,000 deadweight tons of merchant shipping or an amount almost ten times the maximum output of tonnage in American yards in any year prior to the war, would be completed. Such an amount would be as much as all the shipyards of the world combined had built in any year before the war.

Not only were new plants to be built, but in connection with them complete villages to house workers, as in many cases living facilities were either greatly inadequate and inconvenient or were absent altogether. Towards the end of the year, the housing problem became one of the most vital in the entire shipbuilding scheme, and at such places as Bristol, Pa., as well as other places, complete villages were being built.

Contracts for the construction of three government-owned shipyards for building fabricated steel merchant vessels were awarded by the Shipping Board's Emergency Fleet Corporation in September. They went to the Submarine Boat Corporation for a plant at Newark, N. J.; the American International Corporation for one at Hog Island, Pa., and the Merchants' Shipbuilding Co. for one at Chester, Pa. The yards were to cost \$35,000,000 and the government was given an option to purchase the lands on which they are situated. The builders of the yards were given the contracts for building in them 200 ships. The Submarine Boat Corporation was to lay ways for building 28 ships simultaneously and would have facilities and equipment to turn out one 5000-ton ship every two days after the first vessel was completed.

The Submarine Boat Corporation also selected Newark Bay for its yards, which were in operation towards the end of the year, and it was proposed to have equipment whereby 28 ships could be assembled at a time, and each batch could be finished in about 4 months. This plant was completed within some 76 days' time and the first rivet was driven on December 20 in the first ship, 3 ships were laid down before the end of the year, and 5 ways were completed and 5 more in readiness. The Submarine Boat Corporation had contracts for 50 of the ships. Newark Bay was selected for shipyards by the United States Steel Corporation, whose subsidiary, the American Bridge Company, acquired during the year a large tract of land in the Hackensack Meadows, where standardized argo boats would be constructed.

In connection with the development of the shipbuilding plant of the Union Iron Works at San Francisco, extra ground amounting to 100 acres was purchased and an immediate expenditure of \$5,000,000 was contemplated which would eventually be expanded to \$20,000,000. A canal half a mile long, 30 feet deep, and 300 feet wide was to be dug at the new site, marsh land

was to be dredged and filled, and 4 shipbuilding berths from which 1000-ft. ships could be launched were to be constructed in addition to warehouses, machine shops, and other structures.

At Los Angeles also a shipbuilding plant was being started and the Los Angeles Shipbuilding and Dry Dock Company was formed with a capital of \$1,500,000. This company had contracts from the United States Shipping Board and the Emergency Fleet Corporation for the construction of eight steel vessels. Its plant was being constructed during the year in the west basin of the inner harbor of Los Angeles, with complete equipment of shops, warehouses, wharves, and so on, with a proposed 50,000 ton dry dock, 750 feet long by 98 feet wide, later to be built.

**FABRICATED SHIPS.** The great feature of the merchant shipbuilding of the year was the so-called fabricated ship. This was described by R. H. M. Robinson, president of the Chester Shipbuilding Company and the Merchant Shipbuilding Corporation as "a ship on which the work of punching and shaping the plates and shapes, to some extent, assembling and riveting, is done in a fabricating shop, ordinarily employed for bridge or tank work, as distinguished from the usual practice of doing it in a shipyard punch shop." The first of the ships of this type was built at Chester, Pa., and unfortunately fell a victim to a German submarine on its first voyage, but during the year a number of other ships of the same type were launched, and the method proved quite as successful as where the material was fabricated in the plate and angle shop of the shipyard. All of the work of bending except about 5 per cent. can be done at the steel shops except the parts required for the bow and stern where careful work is required of especially trained shipbuilders.

In 1917 there were six large plants for the manufacture of these fabricated ships, two of which had been established by government subsidy, namely, the Hog Island plant of the American International Shipbuilding Corporation, near Philadelphia, and the Port Newark Terminal plant of the Submarine Boat Corporation, near Newark, N. J. There were other plants working on fabricated ships, namely, those of the Chester Shipbuilding Company, Chester, Pa., and the Merchant Shipbuilding Corporation, Bristol, Pa., two new plants of the United States Steel Corporation, the Federal Shipbuilding Company, Kearny, N. J., and the Chickasaw Shipbuilding Company at Chickasaw, Ala., near Mobile. The Chester plant was the only one that during the year was actually constructing ships.

**REPAIRING INTERNED GERMAN SHIPS.** When the United States at its entrance into the war took over 109 German ships that were interned in American ports by their owners, it found that many had been willfully damaged by their crews or German agents acting, as was alleged, under orders from a German central authority, whereby there should be general destruction of these ships effected on or about October 1, the date appointed for unrestricted submarine warfare. It was the intention of the Germans to so damage the vital machinery of these craft that none would be available for a year and a half or two years. This programme was in part

defeated by vigorous measures taken by the United States government, although considerable damage was done before the plan of complete ruin was carried out. Instead of the irreparable damage contemplated by the enemy of which there was documentary proof, there was enough accomplished so that the repair and the installation of new machinery was a serious task which was, however, well handled by the Bureau of Steam Engineering of the Navy Department, so that the last of the enemy vessels could be ordered into service by the end of November. Much of this work was done by expert machinery welders and patchers. Three methods of patching were used: electric welding, oxy-acetylene welding and ordinary mechanical patching with welding in addition, as well as the use of thermite, the most involved use ever attempted in this connection. The number of ships repaired in New York Harbor totalled thirty-one, twenty-one of which had engines and auxiliaries seriously damaged, reaching from the *Vaterland* of 56,000 tons, the largest vessel in the world, to the *Nassovia* of 3900 tons. Excluding the *Vaterland* which was turbine driven there were 118 breaks in the cylinders of the twenty vessels reported and under other conditions, some seventy cylinders would have had to have been renewed as no less than 118 major breaks were detected. Under conditions existing in machine shops in and near the city of New York in 1917, this would have been impossible in any reasonable degree of time, so that when it was possible by patching to repair eighty-two of the major breaks by welding and thirty-six by mechanical patches, the importance of the work may be appreciated. The *Vaterland* was turbine driven with Parsons turbines, there being four turbines for going ahead and four astern turbines, the installation aggregating some 76,000 horsepower. All four astern turbines were badly damaged, and in addition the machinery of the vessel had deteriorated by poor maintenance while in actual service. There was no dock or shipyard of adequate capacity to handle such repairs, which were done while the vessel was in dock under charge of a chief engineer who was appointed immediately to organize the repair forces. In the case of the *Vaterland* as with the majority of the other German ships, there were no plans or drawings available, and this seriously interfered with the beginning of operations. It was no small triumph for American shipbuilders that all of these ships were put into service by the end of the year, and that the *Vaterland* was in condition to transport large numbers of American troops to France.

**CONCRETE SHIPS.** With the great demand for shipping in every part of the world, interest in ships made of reinforced concrete naturally increased, and what before was merely a suggestion was becoming a striking reality. With the comparatively moderate amounts of steel required ferro-concrete has many points to commend it for shipbuilding, not the least of which is expense. The Committee of Lloyd's Register of Shipping, an authoritative body of marine insurance experts, during the year approved plans for the construction of a number of ferro-concrete ships up to 500 tons deadweight capacity. And even larger craft were under construction. While it had been recognized that ferro-concrete would serve for lighters, barges, floating docks, buoys, and other floating objects, where the

weight did not play a very important part, its use in the construction of seagoing vessels presented many points that were quite different. The experience with ferro-concrete structures on land was not entirely applicable, as for example there must be an increased tensile strength which must be carried as far as possible by the reinforced steel. Furthermore, minor cracks that frequently arise, and are considered of minor importance in short structures, cannot be neglected in seagoing ships. At all events, marine insurance underwriters, as well as shipping people generally throughout the world, were looking on concrete vessels as a future development.

In Norway, where important work had been done in this field, there was a distinct enthusiasm for the construction of ferro-concrete craft, due in large measure to the absence of the metals needed for shipbuilding, and the necessity of rehabilitating the merchant shipping fleet which had been severely depleted by war losses. Ship owners, alive to the encouraging results with smaller craft, were ready to take chances as they realized that in the abnormal war times freights were very high, and it would be long before they would fall to a pre-war basis. Consequently any vessel that could float and carry cargo would be relied upon under such conditions to earn large profits. In Norway steel plates and angles were difficult to obtain, but cement could scarcely find a market, and the materials for concrete aggregate were abundant.

In the yard of the Fougner Steel Concrete Shipbuilding Company at Moss, near Christiania, Norway, barges and ships up to 1600 tons capacity were built in 1916 and 1917, and at the end of the year there was under construction awaiting the approval of the Norwegian government, a 4000-ton freighter. This company was formed in May, 1916, by Nic. F. Fougner, a Norwegian engineer, who had specialized in reinforced-concrete construction in the United States, and the Far East, building in 1914 in Manila a 50-ton concrete lighter. The first craft to be turned out in the yards at Moss were lighters of about 100 tons capacity and from this were developed scows of towboats up to 200 tons capacity, which were employed for coasting tows along the Norwegian coast. Several floating docks had also been built.

In the summer of 1917 the first sea-going boat from this yard, the *Namsenfiord*, was launched, which was also the first concrete sea-going boat. It had a successful trial trip on August 1, and received the Class A-1 rating from Lloyd's, being placed in coastwise service in Norway. It was 84 ft. long, 20 ft. wide, and 11½ ft. deep from deck to keel with a draft of 9½ ft. It was 200 tons deadweight or 350 tons capacity, and was driven by a Bolinder crude oil engine of 80 horsepower, affording a speed of about 7½ miles per hour. The hull was monolithic with the deck and the frames round the hatches and those serving as foundation for the cabin aft. Outside the hull were two large wooden fenders. The vessel was admirably suited for the transport of timber, and was fitted with appliances for prompt loading and discharging a Bolinder motor. The vessel was to be put on a Norwegian coasting route.

At the end of the year a 1600-ton boat, 172 ft. long, 31 ft. wide, and 18 ft. high, drawing about 15½ ft. of water, was on the ways ready to be launched, while the 4000-ton capacity ore

#### THE NAMSJENFJORD

A reinforced-concrete ship, 84 feet long and 20 feet wide, launched in the summer of 1917 by the Fougner Steel Concrete Shipbuilding Company at the Company's Yards at Moss, Norway.

carrier for the South Varanger Ire Ore Co., a Norwegian mining company, was under contract. It was 254 ft. long, 40 ft. wide, and had a draft of 19½ ft. with double sides and bulkheads and was to be equipped with two 300-horsepower Diesel engines.

Concrete ships of the Fougner system had a ratio of deadweight to displacement from 12 to 15 per cent greater than the similar ratio in steel ships. The Norwegian yard had a capacity of some 30,000 tons a year.

During the year a reinforced concrete ship of 450 tons was being constructed at San Francisco which was considered experimental, but it represented the most advanced developments in this type of construction. Late in the year, it was inspected by one of the concrete experts of the United States Bureau of Standards, and on the strength of his report, as well as after independent examination, the United States Shipping Board decided to undertake a similar experiment on its own account, probably at one of the southern yards. The board also announced that a Boston, Mass., corporation would build a concrete vessel of 3500 tons at its own expense to be turned over to the Shipping Board and, if accepted, it would receive a contract for twenty more vessels of the same size and type.

**GREAT BRITAIN.** In Great Britain 1917 was an important shipbuilding year as regards merchant tonnage, as many yards were released from naval and repair work to which they had been devoted previously from the outbreak of the war. A system of state control had been established for the various yards and the output in 1917 was far larger than 1916 or 1915. National yards were also established for the building of standard vessels and during the year a number of these were regularly launched. In the increase of the British merchant ships during the year, the standardized ship played an important part. So skillfully were the arrangements made for the fabrication of these vessels that on August 25, within six months from the laying of the keel, the trial trip of the first of these craft could be held. Before the end of September, it was fully loaded and proceeded on its first voyage. This test demonstrated the complete success of the type. The British Government had evolved two types of standard ships each of 8000 tons deadweight carrying capacity, one being a single deck ship and the other a two-deck ship. The single deck vessels were specially adapted for carrying grain, while the twin deck ships were for general cargo. Later in the year it was proposed to construct two smaller types of 5000 tons and 3000 tons deadweight carrying capacity respectively, and other types of standard vessels were being evolved. Not only the hulls but the machinery and engines including the auxiliaries were completely standardized.

In September, 1917, the British Government took over the shipyard which was being laid out at Chepstow, by the Standard Shipbuilding and Engineering Company. This action was somewhat of a surprise to British shipbuilders, but the occupation of the Chepstow yard was believed to be only for the period of the war, and to expedite the policy of the shipping controller. This yard was planned for standard shipbuilding along comprehensive and specially organized lines, and it is believed that its commandeering by the Government will enable the

plans to be carried out more speedily and more effectively.

**GERMANY.** It should not be inferred that the German shipyards were idle during the period of the war. At the Vulkan yards near Bremen, there was launched during the year by the Hamburg-American Line the 16,000-ton steamship *Rheinland*. Indeed, it was reported by the *Berliner Tageblatt* that in 1916 and 1917 the larger shipyards had been increasing their plants and equipment as well as their capital, and that in the two years mentioned eleven of the principal yards which at the beginning of 1916 had share capital of 41,930,000 marks since that time had increased it to 74,200,000 marks. In this number are not included the Stettin and the Bremen Vulkan yards at which a large tonnage had been built for the North German Lloyd and Hamburg-American lines, but there were a number of new shipbuilding works established and the erection of others was planned including the Hamburger Werft Aktiengesellschaft, founded by the Hamburg-American Line, in conjunction with the Allgemeine Elektrizitäts Gesellschaft and the Securitas Shipyard at Hamburg, founded by the Securitas Explosive Works.

It was reported that there had been a certain amount of mercantile tonnage produced from time to time in Germany, notwithstanding the war, although most of the yards were working on naval work.

**CANADA.** At the end of the year the Canadian government was discussing the formulation of a progressive shipbuilding programme involving an annual expenditure of between fifty and sixty millions of dollars. The ships were to be built and owned by the government, and would be operated partly at least by the government and perhaps wholly, and after the war they would be used as a government-owned ocean line to coöperate with the public-owned railways. The existing yards, namely, the Vickers, Montreal; George Davies, Levis; Polson Iron Company, Toronto; Collingwood Shipbuilding Company, Port Arthur Dry Dock and Shipbuilding Company, and the yards at the Pacific Coast were to be utilized to the utmost capacity. After the ships under contract for the British Government had been completed, the Dominion government was to undertake all construction, and there was to be an equitable distribution of labor between the various plants. Steel rolling mills to make plates were to be located and built in Canada so as to make the Dominion independent of steel from the United States. The total capacity of the Canadian steel mills at the end of the year was 300,000 tons per year, while the productive capacity of the shipyards which at the end of the year were working for the British Government, for local interests, and for foreign account can be roughly estimated at from 275,000 to 300,000 tons annually.

**SWEDEN.** On September 14 the steamer *Viken*, 3100 tons deadweight, built for the Swedish Transatlantic Company, was launched from the Lindholmen yard, and on September 29 it was delivered to the owners. The trial trip was to be undertaken as soon as the steamer had taken cargo on board. Important harbor works were about to be undertaken in Stockholm, after deliberations extending over several years. They comprise the construction of the new Hammarby channel, which is to connect the Mälaren with the Saltsjön, i. e., the waters east and west of

Stockholm, and the deep water harbor at Lindarängen which is to form part of the new free harbor project. The municipality of Stockholm was contemplating a 20,000,000 kroner loan to cover the cost of the works in question (18 kr. = 1 £.).

**JAPAN.** Prior to the outbreak of the great war Japan was in possession of nine shipyards capable of building vessels over 1000 tons. The war has caused seven new yards of a like capacity to be added to the list, so that now Japan is capable of constructing fifty-four vessels of over 1000 tons at a time. If the potential capability of the country were to be put into active operation to the fullest extent, Japan would be able to turn out newly constructed vessels aggregating from four to five hundred thousand tons in a year. Last year, however, Japan built only about 250,000 tons, owing to the stoppage of the importation of the materials needed in building and equipping the vessels.

**SHIPPING.** The operation of the merchant fleets of the world during 1917 was so intimately connected with the great war that it is hardly possible to discuss the subject apart from the naval and political issues involved in the war itself. Everywhere there was a vast need of over-seas transportation and the ships that were able to carry on commerce reaped extraordinary profits though naturally the dangers were correspondingly great. At the opening of the year, the factors that were most seriously to be reckoned with were the elimination of the Central Powers from the commerce of the world, a condition of course that had been brought about in the early years of the war. The active prosecution of war by the submarines on the merchant shipping of the Allies and also a more or less unrestricted attack upon neutral shipping were further important considerations. As a result there was an important loss of ships by the British and a serious dislocation of the commerce of the Allies, when it was attempted on the basis of the international law, once recognized. The demands of the Allies for supplies and munitions from over-seas naturally led to an active commerce, and tonnage was at a premium.

The year 1917 produced many important changes. The German government presented a note to the United States to the effect that from February 1, all sea traffic would be stopped by every available weapon without further notice, in every specified zone. It did not matter whether the commerce was enemy or neutral although the United States was to be permitted one steamship a week in each direction to Great Britain making use of Falmouth as the port of arrival and departure. This led President Wilson to sever political relations with Germany, and the political events following his announcement of this fact to the Congress, February 3, are discussed under WAR OF THE NATIONS, and UNITED STATES AND THE WAR.

Some of the significant items in connection with shipping it is purposed to summarize here. According to *Lloyd's Register* for 1916 and 1917, the world's tonnage consisted of 48,683,136 tons, of which 4,151,552 tons were assigned to Germany and 892,618 tons to Austria-Hungary. Inasmuch as German and Austrian tonnage was either interned in home or neutral ports, or had been destroyed by Allied cruisers, it did not figure particularly. On the other hand,

the merchant marine of the Allies and the neutrals was an important part in the prosecution of the war from the standpoint of supplies for the belligerents as well as for actual necessities such as foodstuffs for both belligerents and neutrals. Consequently, the destruction of such shipping, while it might endanger neutrals, was of distinct military advantage to the Central Powers, and in an important way had its effect on the progress of the war. Accordingly, February, 1917, marked a distinct epoch in this phase of the war with which merchant shipping was concerned. For the losses by German submarines, see SUBMARINE OPERATIONS.

It will be apparent that the urgent demand in all quarters then was for ships, and in 1917 as in previous years the construction of ships became most active (see SHIPBUILDING). On the other hand, the operation of ships was quite as important, and on all sides, the various governments took over ships and operated them in the interest of the respective countries. Accordingly, in the United States we find that the United States Shipping Board, whose functions had been defined by the acts passed in 1916 establishing it, was vested with increased powers and permitted not only to commandeered ships building, but also ships in active use owned by private corporations. Accordingly, these ships were taken over into the government service and arrangements were made for their operation according to fixed rates and under conditions established by the Shipping Board.

In Great Britain a somewhat similar condition of affairs took place, and a controller of shipping was appointed to whom was given direction of shipping, both new and in private ownership, and various rates were fixed, and provision made for the distribution of tonnage. With the entrance of the United States into the war, American shipping had still further to deal with the submarine menace, and the government provided for many merchant vessels, crews of naval gunners, and mounted guns on the vessels. The question of cargoes from the United States reaching Germany also became an important consideration, and after the president was authorized to issue notices of embargoes and to carry on this work, through the War Trade Board, complications with neutral shipping resulted. For a number of months, a vast amount of Dutch tonnage was tied up in the Harbor of New York awaiting permission to sail, and in other cases neutrals failed to receive permits where they could not fully satisfy the American authorities as to the ultimate destination of their cargoes.

During the year the British Government appointed as shipping controller, to take over full control of all matters affecting tonnage, Sir Joseph Maclay, of Glasgow, who requisitioned all British shipping, and promptly transferred the unnecessary tonnage in the East and in the South Africa and Australia trades to the Atlantic trades. This shipping was managed by established shipping companies who were restrained from pushing their own interests into a trade in which they had not previously participated, and the tonnage was paid for at government rates. The British ship owners responded loyally to these demands, and greater efficiency was developed in connection with the merchant marine.

Notwithstanding the losses due to submarines

and mines, the year 1917 was a fairly profitable one for British shipping. According to the annual statistics compiled by the magazine *Fair Play* (London), seventy British cargo steamship companies, having a paid-up capital and aggregating £13,566,695 paid dividends in 1917, totaling £2,610,662 or 19.24 per cent upon the capital. These companies had 427 vessels of 1,749,431 gross tons with a book value of £25,773,962. The results of operation in 1917 represented a steady and progressive increase in earnings which in 1904 amounted to but 3.64 per cent upon the capital. For eight years ending with 1911, the average earnings were but 3.3 per cent, but improvements began about that time, and have been constant since. Twenty-three representative British companies operating liners had earnings in 1917 amounting to 14.09 per cent on a paid-up capital of £37,789,577 with considerable reserves which were earning interest. These lines owned 925 vessels of 4,884,243 gross tons with a book value of £81,445,855. In the twelve years ending 1917, the average dividends distributed were 8.12 per cent, a higher gain. This was an increase from 4.46 per cent in 1906. Accordingly 1917 was for both passenger and cargo ships the best year in an extended period.

The condition of over-seas transportation during the war was well illustrated in the announcement made in Great Britain that nine transports had been sunk with a total of about 2000 casualties since the beginning of the war, while more than 11,000,000 soldiers had been transported for long or short voyages. At times there were as many as 200,000 British soldiers afloat.

**UNITED STATES.** In addition to the ship-building programme, the merchant marine of the United States was increased by the seizure of German and Austrian vessels interned in American ports at the beginning of the war. In the United States ports, there were seventy-one German vessels of 535,000 gross tons and in the Philippine ports twenty-three of 86,000 gross tons and in Pacific island ports, one of 6600 tons; the total tonnage of the ninety-five vessels thus seized amounted to 628,837 tons. There were fourteen Austrian vessels interned in American ports prior to the war, but eight of these were sold to the Kerr Steamship Corporation before the United States declared war on Austria. The German merchant fleet thus acquired was indeed large and important. It included the *Vaterland*, which was renamed the *Leviathan*, and other large vessels, many of which were put into service as transports for troops and supplies, while others were used as liners. Some were being operated by the United States army and navy, some by the Shipping Board, and some by steamship firms.

The German submarines, however, were able to attack successfully three of the vessels that were formerly owned in Germany. These were the *Actaeon*, formerly the *Adamsturm*, the *Ovasoo*, formerly the *Allemania*, and the *Armenia*; the last named was hit by a torpedo, but was successfully beached and saved. Other German ships were attacked but escaped.

On October 15, 1917, an order of the Shipping Board requisitioned all American merchant vessels of over 2500 gross tons, although the various details of the plans under which the government was operating these vessels were not

made public to the end of the year. It was assumed that these vessels were being operated by their owners for the account of the national treasury according to the schedule of rates of hire previously published by the Shipping Board. The number and tonnage of American vessels thus requisitioned and afloat amounted to 393 of 2,771,933 deadweight tons, as follows:

	Vessels	Deadweight Tons
Colliers .....	9	64,500
Passenger and cargo...	9	43,558
Tankers .....	58	565,155
Cargo .....	317	2,098,720
Total .....	393	2,771,933

That there would be a substantial decrease in this number due to the operation of the German submarines was, of course, realized, and a discussion of this phase of the matter will be found under **SUBMARINE OPERATIONS**. However, it may be stated that in the course of the year, the United States lost sixty-eight ships, through mines or submarines, ten of which were destroyed before the actual entrance into the war, and fifty-eight during the remainder of the year. The loss of life involved exceeded 300 persons. Of the ships destroyed more than one-half were sailing ships which, as the war progressed, were forbidden by the United States government to enter the submarine zone.

Considering the losses occasioned by the German submarines and mines in comparison with the German and Austrian tonnage taken over by the United States it will appear that America had to its credit a net gain of over 500,000 tons. Furthermore, when the percentage of ships lost compared with the total amount of tonnage that transverse the submarine zone was considered, the loss appears very small. From February 1, 1917, to December 1 of the same year, there were cleared from American ports in the foreign trade vessels aggregating 17,738,900 tons, or approximately 24,834,400 gross tons. The number of ships comprising this tonnage was not stated by the United States government at the end of the year, but when it is considered that the aggregate loss was but 171,061 gross tons, the effect of the submarines on American commerce can be appreciated.

The 393 American vessels over 2500 tons deadweight capacity and already afloat which were requisitioned on October 15, 1917, by the shipping board were immediately assigned to the task of carrying supplies for the Allies and the American forces abroad. Among these requisitioned vessels were twenty-one ships in the Great Lakes trade and twenty-four vessels which were being built on the Great Lakes for foreign account which were ready for launching.

These latter craft were brought to Atlantic coast ports and immediately put into service. A number of them had to be cut in two in order to make the passage through the Welland Canal, which was being extended and reconstructed. In 1917 it had 25 locks of a size that put a limit on vessels of 250 ft. length and 44 ft. beam or about 3500 tons. Some thirty ships not exceeding these dimensions had passed out from the Great Lakes to the Atlantic Ocean and sixteen more had been cut in sections and transported through the canal to be reassembled at Montreal. The larger passenger ships on the Great Lakes had too wide a beam for this

purpose, but other ships that were available were being used in large numbers.

Disregarding any losses by submarines or from other causes, the American merchant marine by the end of 1917 would be very much as indicated in the following table:

	Vessels	Deadweight Tons
Contracted for.....	884	4,724,800
Contracts pending.....	89	610,009
Requisitioned on ways...	428	3,028,608
German and Austrian....	100	700,000
Requisitioned afloat.....	398	2,771,988
Total.....	1,902	11,835,741

With the congestion on the railways of the United States and the extensive use of the merchant vessels for over-seas commerce, the coastwise trade also was affected by an important act approved by the president on October 6, 1917. This act authorized the Shipping Board to suspend the Coastwise Trading Law in favor of foreign vessels so as to secure a more economical use of tonnage. This measure involved a special permit issued to foreign vessels to engage in coastwise trade which specified the limits of the proposed voyage. This act was to expire automatically 120 days after the conclusion of the war.

**FACILITIES FOR WATER TRANSPORTATION.** During the year there was in progress by the Bureau of the Census an investigation of water transportation facilities in the United States for the year ending December 31, 1916. This investigation covered vessels of five ton net register or over, of all classes operating during the year on the coast or inland waters of the United States, including Alaska, or between ports of the United States and foreign countries. Such vessels numbered 37,894 and had a total gross tonnage of 12,250,000. (Gross tonnage is calculated by dividing entire internal capacity, in cubic feet, by 100.) The geographical distribution of this gross tonnage was as follows: Atlantic Coast and Gulf of Mexico, 6,509,000; Mississippi River and its tributaries, 1,621,000; Pacific Coast, including Alaska, 1,185,000; Great Lakes and St. Lawrence River, 2,738,000; canals and other inland waters, 196,000. The distribution according to method of propulsion was: Steam and other power, 6,098,000; sail, 1,089,000; unrigger, 5,063,000.

The above figures were significant in that they implied an increase in number of vessels over 1906 equal to only  $1\frac{1}{2}$  per cent, while there was a decrease amounting to 5 per cent in the gross tonnage. This decrease was explained by the falling off in numbers and tonnage of sailing vessels and unrigger craft, such as barges and canal boats. The decrease in sailing vessels in numbers was from 7131 to 2979 or 58 per cent and in gross tonnage from 1,704,000 to 1,089,000 or 36 per cent. While unrigger craft increased in number from 20,263 to 20,334, there was a decrease in tonnage from 7,130,000 to 5,063,000 or 29 per cent. Steam propelled and other power-driven craft increased in number from 9927 to 14,581 or 47 per cent and in tonnage from 4,060,000 to 6,098,000 or 50 per cent. The average tonnage per vessel for the country as a whole decreased from 345 in 1906 to 323 in 1916.

The proportional increase during the period was most pronounced on the Pacific Coast including Alaska, where it amounted to 61 per

cent, but the greatest rate of increase in tonnage was for the Atlantic Coast and the Gulf of Mexico, amounting to 34 per cent, as against 21 per cent for the Pacific Ocean, including Alaska. For the Great Lakes, the increase in tonnage was 14 per cent. On the other hand, there was a great decrease in tonnage from 4,412,000 to 1,621,000 or 63 per cent on the Mississippi River and its tributaries, and a decrease of 24 per cent for canal and other inland waters.

A significant feature for the year 1916 over the previous census period was the great increase in the value of vessels, gross income, wages paid, and freight carried, though there was a decrease in the number of employees, and also in the number of passengers. While there was a decrease in the gross tonnage taking place as mentioned in sailing and unrigger craft, there was a vast increase in the amount of freight carried. The decrease in the number of passengers carried was due to the reduction in ferry traffic due to the construction of tunnels about Greater New York. The report of the Census Bureau as summarized in its preliminary form is given on the following page.

**SHIPPING LOSSES** (from Submarines). See SUBMARINE OPERATIONS.

**SHOOTING.** The war had a tendency to increase the interest in shooting and the sport was taken up by many who never before had visited the traps. C. H. Newcomb, of the Philadelphia Gun Club, won the amateur championship at the tournament held under the auspices of the New York Athletic Club, breaking 191 out of the possible 200. Ralph L. Spotts, of the New York A. C., the former title holder, finished twelfth in the contest.

The Grand American tournament held at Chicago attracted the largest entry in its history. Mark Arie, of Thomasboro, Ill., captured the national amateur championship at single targets while C. H. Larson, of Waupaca, Wis., carried off the honors in the handicap event. Bart Lewis, of Auburn, Ill., retained his title as champion professional shooter of the United States. Princeton University won the intercollegiate championship, the best individual work being done by C. V. Caesar, of that institution.

**SIAM.** An independent kingdom of south-eastern Asia. It extends approximately from the 6th to the 20th degree of north latitude and from the 97th to the 106th degree of east longitude; its length from north to south is approximately 1200 miles, and its greatest breadth, 480 miles. The coast line is 1300 miles in length. Total area, about 198,900 square miles. Bangkok is the capital. On July 27, 1917, Siam declared war on Germany and Austria, interning subjects of those countries and seizing enemy ships. See below.

**POPULATION, ETC.** The country is divided into seventeen monthons (circles), subdivided into 79 muangs (provinces), which are again subdivided into 409 amphurs (districts); these are in turn made up of 3993 tambons (villages), divided into mu bans (hamlets). The population of the kingdom is said to be 8,266,408. Chinese coolie immigration, 1913-14, 70,162; emigration, 62,088. There are upward of two hundred Europeans and Americans resident in Siam, mostly in Bangkok. That city has 628,675 inhabitants, of whom 197,918 are Chinese. The religion of the court of Buddhism, and large educational powers are in the hands of Buddhist monks.

## TRANSPORTATION BY WATER—YEAR ENDING DECEMBER 31, 1916. PRELIMINARY REPORT ISSUED BY THE CENSUS BUREAU.

Statistics for the year ending December 31, 1916, for all American documented and undocumented vessels of five tons net register or over that were operated on the coasts or inland waters of the United States, including Alaska, or between ports of the United States and other countries. The statistics do not cover vessels owned by the Federal Government, stationary wharf boats, or house boats without propelling power. Comparative summary, active craft, by geographic divisions; 1916 and 1906:

Census Year	United States*	Atlantic Coast and Gulf of Mexico	Pacific Coast (including Alaska)	Great Lakes and St. Lawrence River	Miss. River and its Tributaries	Canada and Other Inland Waters
Number of vessels.....	37,894 1916 37,321 1906	21,858 20,082	4,092 2,537	2,856 2,990	7,239 9,622	2,049 2,140

\* Fishing craft are not included in the comparative summary, because not taken in 1906. In 1916 there were 5,216 such vessels in operation having a total gross tonnage of 145,246.

† Decrease.

‡ Gross tonnage is calculated by dividing the entire internal cubical capacity of a vessel, in cubic feet, by 100.

§ Includes lighterage, or harbor work, amounting to 123,350,315 tons in 1916, and 88,926,046 in 1906, the figures for 1906 being exclusive of harbor work on the Great Lakes.

¶ Bureau of Statistics, Department of Commerce and Labor, monthly summary, Internal Commerce of the United States, December, 1906; includes 2,003,453 net tons of bunker coal.

Agriculture is carried on under primitive conditions. Irrigation is practiced, and rice is the leading crop. The product next in importance after rice is teak. The forests in which this species occurs are situated for the most part in the monthons of Bayap, Nakonsawan, and Pitsanulok, and are leased to private companies for a term of years, usually fifteen. The only minerals worked on a commercial scale are tin and wolfram. Seven-eighths of the tin comes from the Puket monthon.

**COMMERCE, ETC.** The total imports for 1915-16 were valued at £5,803,850, and the exports at £8,151,940. The United Kingdom contributed imports valued at £994,380 and received exports valued at £819,622; China, £688,069 and £49,318; British India, £701,638 and £230,070; Singapore, £1,265,263 and £4,086,705; Hongkong, £1,139,800 and £2,395,769.

There were entered at the ports in the 1914-15 trade, 898 steamers of 805,638 tons; cleared, 896 of 802,255. Entered 1915-16, 862, of 729,210 tons.

The Siamese government *Gazette* announced the registration on October 8, 1917, of a new Siamese shipping company under the name "Borisat Panich Navi Siam (Ltd.)," with a nominal capital of 1,000,000 ticals in shares of 100 ticals. Among the promoters of the company were Siamese princes, noblemen, and officials. This company was to take over the two German steamships and one steam lighter that had been recently seized and condemned as prizes by the Siamese prize court.

"Progress in the construction of the Siamese railroads foreshadows the establishment of a rapid land route between the Gulf of Bengal and the China Sea," says the *Geographical Review*, December, 1916. "As soon as the Siamese railroads become linked with the systems in China and Indo-China, an overland short-cut will become available and the long voyage around Singapore may be avoided. The first Siamese railroad, opened in 1897, ran between Bangkok and Ayuthia, the old capital. This, the northern part of the system, was extended up the valley of the Menam River to Lampang on the upper Meping, a western tributary of the Menam. The short distance to Chiengmai, the northern capital, was expected to be completed shortly. The region to be tapped here is rich in natural resources, which, with adequate transportation, would find a ready market in Bangkok. The southern part of the system embraces the coastal districts of the Gulf of Siam. Its most important section would eventually run along the whole length of the Malay peninsula. Of a total of 470 miles, 120 were in operation on April 1, 1915. In the budget estimates of Siam for the fiscal year ending March 31, 1918, appropriations amounting to \$1,369,000 were made for the extension of the northern railway line, and \$212,010 for the construction of branch lines of the southern railway. There were also appropriations of \$1,717,355 for the irrigation project under construction, \$48,877 for Bangkok water-works, and \$321,252 for the completion of the new royal yacht.

Estimated revenue, 1916-17, £5,549,348; expenditure, £5,549,348; extraordinary expenditure against capital account, including expenditure from loans, £1,418,062. The reigning king is (Somdet Phra Paramindr). Maha Vajiravudh, born January 1, 1881.

**HISTORY.** On July 27, as noted above, the kingdom of Siam declared war against the Central Powers. For a long time past the Entente Allies had made demands upon her. After the war broke out a large number of Germans who were in the Indo-Chinese possessions of France and in the Indian territories of Great Britain sought refuge in Siam. Many of them recruited bands from among the natives and organized movements against the Allies while the government of Siam looked on apparently with indifference. At last the French government called upon the authorities at Bangkok to choose between the Entente Allies and their enemies, and Great Britain which before the war had had a privileged position and preponderant influence in Siam, presented an ultimatum along with France to the Siamese government. The break with Germany followed. It was regarded as likely to bring important consequences and to restore order to both the French and the British possessions in the East. It obliged the Germans now to seek refuge in the Dutch East Indies. Thus the last country of Asia was closed to the Central Powers.

**SIBERIA.** That part of Russia which occupies northern Asia. The area is stated at 4,831,882 square miles. Some idea of the vast extent of this region may be had by comparing it with the United States, whose continental area (excluding Alaska) is 3,026,789 square miles. Population of Siberia, 10,377,900, according to the estimate of January 1, 1915. Siberia consists of the governments of Tobolsk, Tomsk, Irkutsk, and Yeniseisk, and the provinces of Transbaikalia, Yakutsk, Primorskaya, Amur, Kamchatka, and Sakhalin. There is much fertile land in Siberia, and since the opening of the Trans-Siberian Railway the population has rapidly increased. Estimated population of the larger cities prior to the great war were as follows: Irkutsk, 129,700; Tomsk, 116,700; Vladivostok, 91,500; Krasnoyarsk, 87,500; Chita, 79,200; Blagovyeschensk, 62,500; Novo-Nikolaevsk, 63,000; Barnaul, 61,300; Khabarovsk, 51,300; Nikolsk-Usuriysk, 47,400; Tyumen, 39,200; Tobolsk, 25,200; Yakutsk, 10,800. The western capital of Siberia is Tomsk; the eastern capital, Irkutsk. See ANTHROPOLOGY; and RUSSIA.

**SIBERT, WILLIAM L.** See WAR OF THE NATIONS, *Military Operations* (9).

**SIERRA LEONE.** A British colony and protectorate on the west coast of Africa, bounded by French Guinea and Liberia. The area of the colony is about 4000 square miles; population, 75,572, of whom 702 white. Freetown, the capital, with the best harbor in west Africa, had 34,090 inhabitants. The colony and protectorate together have an area of 32,110 square miles; population, 1,327,560.

Sierra Leone's leading export is palm kernels, valued in 1915 at £504,033; the export of kola nuts amounted to £235,406; other exports are palm oil, ginger, and piassaba. Statistics of trade and finance for successive years:

	1912	1913	1914	1915
	£	£	£	£
Imports	1,424,864	1,750,808	1,405,049	1,255,755
Exports	1,540,754	1,731,252	1,250,478	1,254,621
Revenue	559,855	618,583	675,689	504,424
Expend.	524,417	622,489	680,146	548,771
Shipping	2,676,471	2,931,085	2,780,118	1,635,119

\* Tonnage entered and cleared.

**SILESIA.** 1. A crownland of Austria. Area, 1987 square miles. Population at census of December 31, 1910, 756,949 (2.65 per cent of the Austrian total), as compared with 680,422 in 1900. Austrian subjects in 1910, 741,456; of these, German was the vernacular of 43.90 per cent; Polish, 31.72 per cent; Bohemian, Moravian, Slovak, 24.33 per cent. Catholics formed 84.52 per cent of the population; Evangelicals, 13.58; Jews, 1.77. The capital is Troppau (population in 1910, 30,762). Silesia has a diet of 31 members and is represented by 15 members in the Austrian Reichsrat.

2. The largest and, after the Rhine province, the most populous province of Prussia. It occupies the southeastern part of the kingdom. Area, 15,573 square miles. Population at the census of December 1, 1910, 5,225,962; 42.08 per cent were Evangelical and 56.69 per cent Roman Catholic. Capital, Breslau.

**SILK.** The advance in prices which was a marked feature of all raw materials in 1917 affected the silk industry, and the advance in price in Japan raw silk, which started in the early days of January, continued steadily, with only a few minor reactions, until the middle of August, at which time were established the record high figures for over forty years, a period going back to the time when the American silk industry was still in its infancy. The highest price was reached on August 13, which was \$7.10 per pound, an advance of no less than 37 per cent over quotation ruling on January 2, 1917, which was \$5.20 per pound. This may be compared with the low record price of \$2.75 made in November, 1914. In the next two months there was a severe decline, which resulted in heavy losses to those who had believed that the price would reach \$10 per pound. This decline was arrested in the middle of October by action taken by the Japanese reelers which resulted in a fixation of prices.

There was something of a falling off in the consumption of silk during the fall season, but this was a falling off only as compared with the usual activities of the spring season, for there was a diminishing demand as usual in the last two months of the year. In spite of this, there were some mills which had actually booked more business in the last two months of 1917 than were recorded in the year 1916.

It is evident that in the future there must be a greater activity in the silk industries, for silk fabrics must of necessity be given more and more preference by costumers as the result of the exceptionally large requirements of woolen goods on the part of the government. In December, resolutions were passed by garment makers at a special recommendation of the Commercial Economic Board of the Council of National Defense, that woollens be conserved and more silk and cotton fabrics be used in the manufacture of garments.

The shipments of Japan raw silk during the year were about 143,000 bales, of which 125,000 went to United States and 18,000 to Europe. The report in the last part of the year from the Milan market indicated a very full demand for European requirements. Lyons is said to have been quite bare of silk.

The following table shows the raw silk production, including tussah silk, in 1915-16 and 1916-17:

Crops in Pounds		1916-17	1915-16
Europe .....		8,977,000	7,087,000
Viz.:			
Italy .....		7,963,000	6,349,000
France .....		485,000	286,000
Austria .....		331,000	331,000
Spain .....		198,000	121,000
Levant .....		2,293,000	2,293,000
Asia: Total quantity exported *		47,603,000	41,154,000
Viz.:			
• China, Shanghai .....		† 9,426,000	9,836,000
• China, Canton .....		5,543,000	4,083,000
Japan, Yokohama .....		82,374,000	27,013,000
India (estimated) .....		260,000	220,000
Total, pounds .....		58,878,000	50,534,000
Tussah, raw .....		1,805,000	2,558,000
Grand total, pounds.....		60,678,000	53,090,000

\* The production of raw silk in China is an absolutely unknown quantity.

† Excludes Tussah silk.

The figures for Asiatic silks are the actual shipments from the various countries of production, viz.: China, Canton, Japan, etc.

The domestic consumption of Japan is estimated to be approximately 30 per cent of the production. The remaining 70 per cent, which is exported, being 32,373,675 pounds during the season 1916-17. The total production equals the export divided by 70 and multiplied by 100, which therefore amounts to 46,248,100 pounds.

The domestic consumption of China (including Tussah silk) is estimated to be 55 per cent of the production in average years. The remaining 45 per cent, which is exported, being 16,774,357 pounds from Shanghai and Canton during the season of 1916-17. The total production equals the export divided by 45 and multiplied by 100, which therefore amounts to 37,276,300 pounds.

**SILVER.** The silver production of the United States in 1916 was 74,414,802 fine ounces. This was a decline of over 2,000,000 ounces from the production of 1915. There was a decline also in the production in Canada and Mexico. At the same time the price of silver increased, and in May, 1916, reached a record price of 77¼ cents.

The production of silver in 1917 was 74,244,500 ounces. The largest quantity, 14,315,300, was obtained from the mines of Utah. Montana ranked second with 13,711,100, and Idaho third with 11,683,100. The Bureau of the Mint and the Geological Survey have issued the following joint statement as to the preliminary estimate of the production of silver in the United States during the calendar year 1917:

State or Territory	Silver Fine Ounces
Alaska .....	1,851,100
Arizona .....	8,183,200
California .....	1,989,800
Colorado .....	8,168,600
Idaho .....	11,683,100
Illinois .....	8,300
Maryland .....	1,100
Michigan .....	686,700
Missouri .....	21,100
Montana .....	13,711,100
Nevada .....	11,441,000
New Mexico .....	1,818,700
North Carolina .....	2,800
Oregon .....	215,700
South Dakota .....	191,100
Tennessee .....	99,300
Texas .....	583,200
Utah .....	14,315,300
Vermont .....	400
Virginia .....	9,400
Washington .....	257,000

State or Territory	Silver Fine Ounces
Wyoming .....	4,900
Philippine Islands .....	16,600
Total .....	74,244,500

Compared with the 1916 production—74,414,802 fine ounces—these figures indicate a reduction in silver output of 170,302 fine ounces.

**WORLD PRODUCTION.** The world production of silver in 1916 was 156,626,521 fine ounces, valued at \$107,519,408. Of the total production 122,712,628 came from the mines of the United States, Canada, and Mexico. In South America there were produced 11,839,822 ounces; in Europe, 8,591,029; in Asia, 5,840,867; and in Australia, 3,863,418. The industrial consumption of silver in 1916 throughout the world was valued at \$24,083,644. An estimate for 1917 for the world was approximately 167,000,000 oz. based on the assumption that the amount produced outside of the United States/increased 10,000,000 oz.

An unique consideration, however, in connection with silver in 1917, was the demand which naturally affected prices which rose to a point higher than for forty years. Furthermore, this demand was affected by government control so that the markets of the world in a way were restricted. The tendency to rise in the silver market was first manifested in 1916 and by June a price around 75 cents per ounce was recorded. At this time purchases were being made for the Far East for coinage purposes, and a few weeks later by the Russian government for shipment to Vladivostok. Inasmuch as Great Britain and the United States were unwilling to release gold for export, silver was forced to the Far East for the purpose of paying the increased balance of trade due to good crops and higher prices. This condition was responsible for the gradual mounting of silver during 1917 to a price of 79.010 cents in New York, the average for July, then to 85.407 cents, the average for August, and 100.740 cents, the average for September, the highest quotation recorded during the latter month being \$1.08½ in New York and 55 pence in London.

**SIMMONS COLLEGE.** A non-sectarian institution for the education of women, located at Boston, Mass. In the fall of 1917 there were 1035 students and 119 members of the faculty. Volumes in the library numbered 27,531. Productive funds in 1917 amounted to \$2,290,266 and the income therefrom to \$83,149. A residuary bequest of \$12,500,000 was received from the estate of Miss Helen Collamore. Simmons College was founded in 1899. President, Henry Lefavour, LL.D.

**SIMS, WILLIAM S.** Vice Admiral, U. S. N., ranking American naval officer abroad and in command of the United States destroyers operating in European waters. He was born at Port Hope, Canada, in 1858, and graduated from the United States Naval Academy in 1880. He served on the North Atlantic, Pacific, and China stations and from 1897 to 1900 was naval attaché to the embassies at Paris and St. Petersburg (Petrograd). While holding this position he was intrusted with the buying of ships and supplies for the United States Navy. In 1902-09 he was inspector of target practice at the Bureau of Navigation and during the last two years of this period was also naval aid to the

president. He then commanded the *Minnesota* in 1909-11, was a member of the War College, 1911-13, and from 1913 to 1915 commander of the torpedo flotilla of the Atlantic fleet. In 1915 he was assigned to command the new dreadnaught, *Nevada*. In 1916 he was made president of the Naval War College and commandant of the Second Naval District. In August, of the same year, he was made a rear admiral. Just before war was declared on Germany he was sent abroad as a special representative and observer. After the war began he immediately entered into conferences with British and French naval officials as to the best methods of naval coöperation between the nations at war with Germany. When it was decided to send American warships abroad, Admiral Sims was put in charge of the operations of these craft. In recognition of his services rendered since he went abroad he was appointed vice admiral.

**SINGAPORE.** See STRAITS SETTLEMENTS.

**SINN FEIN.** See GREAT BRITAIN, *History*.

**SIOMINE.** An iodine preparation containing 78.5 per cent of this element. Its chemical name is hexamethylenamine tetraiodide (CH<sub>2</sub>)<sub>6</sub>N<sub>4</sub>I<sub>4</sub>. Its therapeutic effects and dosage are the same as those of potassium iodide, and the advantage claimed for it is that it can be administered in solid form. Siomine is a red powder, having an odor and taste peculiar to itself.

**SKATING.** The international outdoor championships in 1917 were held at Saranac Lake, N. Y. The winners of the principal races were: 220 yards, Edward Horton, Saranac Lake; three-quarter mile, Sigurd Larsen, Chicago; one mile, Sigurd Larsen, Chicago; two miles, Arthur Staff, Chicago; three miles, Arthur Staff, Chicago. In the indoor championships held at Pittsburgh, Pa., Staff captured the quarter-mile, half-mile, three-quarter mile, one mile, and three-mile races. Special races were contested during the year in the rinks of the various large cities, New York, Pittsburgh, and Boston giving an especially large patronage to these events. The popularity of skating as a recreation was again attested by the large number of new rinks and ice palaces opened during 1917.

**SLAVONIA.** See CROATIA AND SLAVONIA.

**SMALLPOX AND VACCINATION.** There are apparently still some persons who believe that the administration of vaccine matter by mouth will confer immunity to smallpox, in the same way as by the ordinary method. The futility of this belief has been shown before, but Garrison has experimented with the method again, and proved its utter worthlessness. Twenty-five persons were given vaccinium by the mouth and twenty of them were subsequently proved to be unprotected, since vaccination by the ordinary scarification method was successful in each case. The simple reason for introducing vaccine material directly into the tissues is that when introduced into the stomach the material is digested and robbed of its specific properties before it can be absorbed. See VITAL STATISTICS.

**SMITH COLLEGE.** A non-sectarian institution for the education of women, located at Northampton, Mass. In the fall of 1917 there were 1946 students and 205 members of the faculty. Volumes in the library numbered 67,647. Productive funds in 1917 amounted to \$2,242,591 and the income therefrom to \$162,

195. The college was founded in 1871. President, William Allen Neilson.

**SMITH-HUGHES ACT.** See AGRICULTURAL EDUCATION.

**SMITHSONIAN INSTITUTION.** The secretary of the institution, Charles D. Walcott, in his report for the year ending June 30, 1917, reviewed the affairs of the institution proper and the operations of its several branches. A separate article will be found on the United States National Museum (including the National Gallery of Art and the Freer Art Gallery). The total permanent funds of the institution, when the report was issued, were \$1,062,134. The income for the year amounted to \$133,360 and the disbursements, \$124,127, leaving a balance of \$9232. The institution was charged by Congress with the disbursement of appropriations amounting to \$581,500 for the year ending June 30, 1917. The secretary, Mr. Wolcott, made geological investigations in the Canadian Rocky Mountains obtaining interesting and important results, his work being illustrated by a large number of photographs. He found the line of demarcation between the Lower and Middle Cambrian to be high up in the section on the face of the cliffs at Wonder Pass, and throughout the Assiniboine massif. Dr. George P. Merrill visited the gem and feldspar quarries in Maine, adding interesting material to the mineral exhibit of the National Museum. Dr. R. S. Bassler and Mr. C. E. Reaser made investigations in western Maryland, proving that graptolites—extinct organisms useful in determining the age of geological formations which contain few and often no other kinds of fossils—were the key to the geologic structure of the region. Dr. Bassler successfully explored the Ohio Valley for fossil algae and coral reefs, securing an excellent exhibit for the museum. Examination by Dr. Hrdlička, of the museum, of human remains that were found at Vero, Fla., and believed to be of extreme age, proved to be decidedly against that belief. Similar conclusions were arrived at in the investigation of human remains found at Demere Key, Fla. John B. Henderson and Dr. Paul Bartsch brought from Eastern Cuba and Haiti many interesting specimens of land and fresh water mollusks, several new birds, some very interesting cacti and other plants, and a general invertebrate collection. A. S. Hitchcock made botanical explorations and discoveries in the Hawaiian Islands, especially among the grasses, and Arthur deC. Sowerby successfully continued his biological work in northeastern China. Dr. W. L. Abbott made an interesting natural history collection in Santo Domingo; H. C. Raven continued to make natural history and ethnological collections in Celebes, Dutch East Indies; and early in 1917 an expedition with the title of the Collins-Garner Congo Expedition left in the interests of the Smithsonian Institution for the French Congo and the neighboring parts of West Africa. An expedition for taking measurements of solar radiation in South America was prepared, but owing to war conditions it was delayed, being temporarily located at Hump Mountain, N. C., in May, 1917. The process invented by F. G. Cottrell for the electrical precipitation of suspended particles, the patents for which are administered commercially by the research corporation, is now in successful use by a score of smelting and refining companies. The Na-

tional Research Council, whose members include several of the staff of the National Museum, continued in 1917 to organize scientific investigations concerning the national defense and industries affected by the war. Dr. George E. Hale, Dr. Robert A. Millikan, and Dr. Cary T. Hutchinson were active in the executive and administrative part of this work. Of the series of *Smithsonian Contributions to Knowledge* one memoir was published, entitled "A Contribution to the Comparative Histology of the Femur," by Dr. J. S. Foote. Of the series of *Smithsonian Miscellaneous Collections* nineteen papers forming parts of five volumes were issued. The *Smithsonian Annual Report* for 1916 was not received before the close of the year on account of the unusual amount of war printing at the Government Printing Office.

In 1917 the library contained more than 500,000 bound volumes and pamphlets. More than 9000 new titles were added during the year. Dr. John Donnell Smith, of Baltimore, donated the whole of his botanical library to the institution, and a large part of it was housed during the year. The Museum Library received 5128 volumes and pamphlets. A reception for the French Scientific Mission to the United States was held in the Smithsonian Building on the evening of June 14, 1917. For the activities of the Bureau of American Ethnology, see the article ANTHROPOLOGY. The International Exchange Service handled during the year 268,625 packages of governmental and scientific publications. The National Zoological Park reported 1,106,800 visitors, a daily average of 3032. Mr. Ned Hollister succeeded in office Dr. Frank Baker, superintendent of the park for twenty-six years. On account of the war it was found practically impossible to complete the preparation of the International Catalogue of Scientific Literature. Part of it, however, was published by the Central Bureau at London, which brings the total number of volumes published since 1901 up to 216 volumes containing about 3,000,000 references to current scientific periodicals.

Henry White, of Maryland, was appointed to the Board of Regents to succeed Dr. Andrew D. White, of New York, who resigned.

**SNOWFALL.** See METEOROLOGY.

**SOCCER.** See FOOTBALL.

**SOCIAL ECONOMICS.** The development of economic and sociological sciences in recent years has shown an increasing tendency to lay stress upon the welfare aspects of industrial organization and social conditions. Under the influence of the democratic ideal and stimulated by the increasing importance of organized labor, together with the growth of emphasis upon social service and the doctrine of trusteeship in the ownership and management of wealth, increasing attention has been given to problems of distribution of wealth, greater justice in methods of taxation, protection of women and children from long hours, low wages, and other exploitative conditions of industry, the reduction of poverty and crime, and the development of a normal life for all members of society. Consequently social economics has carried on investigations into causes and consequences of long hours, low wages, and other evil conditions of industry; bad housing and lack of recreation; alcoholism; prostitution and crime; poverty and inefficiency. It has laid less emphasis upon the

quantity of goods produced and more on the conditions of production and the distribution of the product. Social economists have been active in promoting labor and other welfare legislation and have strongly favored the extension of the activities of government and a strengthening and perfecting of governmental administration. Other matter of interest in this field will be found in the following headings: CHILD LABOR; LABOR; LABOR LEGISLATION; MINIMUM WAGE; OCCUPATIONAL DISEASES; OLD AGE PENSIONS; PENSIONS FOR MOTHERS; PROSTITUTION; WOMEN IN INDUSTRY; WORKMEN'S COMPENSATION.

**SOCIAL HYGIENE.** See PROSTITUTION.

**SOCIAL INSURANCE.** Since the enactments of the social insurance measures in Great Britain in 1911, there has been a rapid growth of opinions favorable to them and extension of public action along similar lines in the United States. The growth of workmen's compensation, together with widespread public interest in the prevention of accidents and diseases, has been the chief result of this agitation. There has, however, been an increasing conviction that it would be desirable for the community to assume through insurance measures a large proportion of the burden of sickness, unemployment, and old age. Social investigation has shown that among the chief causes of poverty are industrial accidents and disease, invalidity (due also in large part to industrial casualties), the deteriorating effects of sickness and of unemployment, the helplessness of old age, and the burden

which rests upon the families of the poor in case of death, especially of the mother or the chief breadwinner. Now all of these events, while they are more or less inevitable in human affairs, nevertheless occur in such a manner that they each constitute a proper field for the application of insurance principles. It is believed that in this manner a very large proportion of existing poverty might be prevented. Thus the family that sinks into poverty and crime and is set adrift because the father and husband is unemployed could be held together on its normal plane of living provided an insurance fund were available for its support during the inevitable periods of industrial slackness (see UNEMPLOYMENT). A similar argument applies to occupational diseases (q.v.); industrial accidents (see WORKMEN'S COMPENSATION); and to a large extent the same is true of the indigence of the aged (see OLD AGE PENSIONS).

In this country the term social insurance has connected itself primarily with the idea of health. The first advances in this field were made in Massachusetts and California where investigating commissions were authorized in 1916 to report in January, 1917. The reports of these commissions were not followed by legislation but the commissions were continued. In addition, investigations were provided for by Connecticut, Illinois, New Jersey, Ohio, Pennsylvania, and Wisconsin. In Connecticut the scope of the investigation is to include old age pensions, sickness insurance, minimum wages, unemployment, and the improvement of country life. In Illinois and Pennsylvania the investigation bears primarily upon health, but includes sickness or accidents not covered by the compensation laws. In New Jersey a commission considering old age dependency found workmen's health a preliminary problem. In Ohio the commission will investigate health insurance, sickness prevention, and old age pensions; whereas in Wisconsin the commission is instructed to "thoroughly investigate the subject of social insurance," no restrictions being placed on its scope. Most of these commissions are authorized to compel the attendance of witnesses. In all States appropriations were made: in Illinois, \$20,000; Ohio, \$25,000; Pennsylvania and Wisconsin, \$5000; Connecticut, such sums as are granted by the board of control. Health insurance measures were introduced in at least a dozen States in 1917.

**COMMISSION REPORTS.** The California Commission, which issued a most extensive report, was unanimously agreed that health insurance was the logical and the most practical step in social reform following workmen's compensation and that all efforts should be concentrated upon problems connected therewith. It said, "In order to meet the problems of destitution due to sickness, and in order to make health insurance a valuable adjunct to the broad movement for the conservation of public health, any legislation on this subject should, in the opinion of the commission, provide (a) for a compulsory system for the conducting of the insurance by non-profit making insurance carriers; (b) for a thoroughly adequate provision for the care and treatment of the sick, and (c) for contributions from the insured, from industry and from the State." Governor Hiram W. Johnson strongly commended the work of

the commission and expressed the strongest approval of the principle of health insurance. Owing to the probability that a compulsory contributory health insurance act would be declared unconstitutional by the California courts both houses of the legislature passed a constitutional amendment thereafter submitted to the people for ratification in which it was declared that "it is the policy of the State of California to make special provision for the health and welfare of those classes of persons and their dependents, whose incomes, in the determination of the legislature, are not sufficient to meet the hazards of sickness. The legislature may establish a health insurance system, applicable to any or all such persons, and for the financial support of such system may provide for contributions, either voluntary or compulsory, from such persons, from employers, and from the State by appropriations."

Members of the Massachusetts Commission represented a greater diversity of opinion. They were unanimous in endorsing the principle of health insurance and a majority approved the main features of the bill introduced on the State legislature by the American Association for Labor Legislation. This majority held that in order to be effective a sickness insurance law must be compulsory and must distribute its costs among employer, employee, and the State. The majority of the commission also agreed that private stock companies operating for profits must be definitely excluded from the field of health insurance. It favored the carrying of health insurance by mutual associations controlled by an equal representation of employers and workmen. A striking event of the year was an inaugural address to the legislature in January by Governor Samuel W. McCall urging the enactment of a compulsory health insurance law. He said, "I am strongly of the opinion that there is no form of social insurance that is more humane, sounder in principle, and that will confer a greater benefit upon large groups of our population and upon the commonwealth as a whole than health insurance." Throughout the year there was much discussion of the subject of health insurance in Massachusetts, especially among physicians, employers, and trade unions. While opinion generally favored the principle there was hopeless disagreement as to the details of organization. The commission charged with the preparation of a bill consequently came to favor a measure providing for the extension of public health activities to include the care at public expense of all school children. It was believed that the experience under such a measure together with the education of the community thereby achieved would make possible the enactment of a measure for the insurance against sickness of adults of the working class.

**OTHER DEVELOPMENTS.** Much attention was given to the problem by the Medical Association and by State and local bodies of medical men. Trade unions likewise actively discussed problems of sickness insurance. The American Federation of Labor had in 1916 condemned sickness insurance by companies seeking profit. But President Gompers was strongly opposed to compulsory insurance by State authority. On the other hand, many of the most important labor leaders were favorable, including John Mitchell, James M. Lynch, James Duncan, and William

Green, the first two connected with the New York State Industrial Commission and the last two with the American Federation of Labor. The National Women's Trade Union League, at its convention in June, strongly approved health insurance including maternity care. Similar resolutions were passed by various State and local organizations. Manufacturers were on the whole opposed, primarily on account of the cost which must largely be borne by business. The American Medical Association at its meeting in June declared that efforts must be made to safeguard the interests of the medical profession in the enactment of sickness insurance and insisted that such laws should provide for freedom of choice of physician, payment in proportion to work done, the separation of medical supervision from the daily care of the sick, and for the adequate representation of the profession on administrative bodies.

**SOCIALISM. STOCKHOLM CONFERENCE.** One of the most widely debated subjects of the year was the Socialist proposal of a peace congress, including representatives from the fighting nations, to be held at Stockholm. The proposal was made at the instance of the Russian Council of Workmen's and Soldiers' Delegates who published on May 30 an appeal for the reassembling of the International and for the calling of a peace conference. Thereupon (May 30) the Austrian and German Socialists drew up a peace programme of which the main points were as follows: 1. No annexations. 2. No indemnities. 3. The Slav countries of the south and the Austro-Hungarian crown lands to remain in the dual monarchy, but the Socialists to support the efforts of the populations to obtain self-government. 4. Finland and Russian Poland to form independent states, and Galicia to be self-governing under the sovereignty of Austria. 5. Restoration of commerce on land and sea, modification of the productive system, completion of an international administration for all sea routes and interoceanic canals, and construction and administration of railways on an international basis. 6. Return to the maritime principles established by the Treaty of Paris in 1856 especially as regards the prohibition of the capture or arming of merchant vessels. The programme further opposed the annexation of Belgium; favored an independent Serbia, which, joined to Montenegro, should have an outlet to the sea; and declared that the Balkan states might arrange their own affairs without the interference of the other powers. It made no mention of Alsace-Lorraine. At the same time the Social Democratic majority in Germany set forth a programme including limitation of armaments, compulsory arbitration, the "open door" for colonies, free trade, and democratic control of diplomacy; while the German minority Socialists included in their peace aims the restoration of Belgium and Serbia, an independent Poland, and a plebiscite for Alsace-Lorraine.

In the Entente countries the question of giving passports to delegates was the subject of long and acrimonious debate. In France, where the Socialist party had gradually been won over to views formerly held only by the minority (see FRANCE, *History*, and SOCIALISM in preceding YEAR BOOK) the Socialist National Council decided to send delegates to Stockholm, thus raising the question whether the government should grant passports. To this there was

strong opposition. A bill was introduced in parliament providing that whoever forms, or tries to form, an agreement, or who enters into negotiations of a political, diplomatic, military, economic, or social nature without regard to the constituted authorities of the country, either with the subjects of an enemy power or with a body comprising enemy members, shall be punished by five years' imprisonment and a fine of from 10,000 to 50,000 francs. Political opinion, however, was not altogether hostile to the sending of delegates to Stockholm. Some argued that it would be an advantage not to leave the Russian revolutionists at the mercy of the Germans who, they said, were past masters in the art of leading their comrades in foreign countries by the nose, and they favored some sort of a conference in which the Russian revolutionists would take the initiative and in which the question of responsibility for the war should be squarely put. On the day after the Nationalist Congress the following presentment of this side of the case was published: "The Russian army, being convinced that the purposes of the government in regard to the war were the purposes of the army also, wishes to have the same assurance in regard to the purposes of the Allied governments. The Russian soldiers think that the Allies ought not to hesitate to declare their objects in fighting, in contrast to the objects of the Central Powers. If the Central Powers hesitate to start a revolution in their own countries and if they do not oblige their governments to renounce their imperialist aims, the power of the democratic armies of the Allies will be decisive. To the extent that the French Socialists give as they did yesterday proofs of complete accord with the Russian Revolution, they reinforce the Russian army itself. It is to aid Kerensky in his championship of the war." On June 1, M. Ribot declared that the government would not issue passports to the delegates, and that passports would be issued for Petrograd only when it was certain that there would be no meeting with enemy delegates. This announcement was received by the chamber with enthusiasm. M. Ribot declared that in peace negotiations no party can take the place of the government. Peace could come, he said, from victory alone; and it must be a French peace, in the interest of all France, and not merely in that of a particular party. On June 4 the delegates from the German Socialist majority, under the leadership of Herr Schiedemann, arrived at Stockholm. Their spokesman declared that he had little hope that peace would result from this conference, but since all the world desired peace they had come there in the hope of obtaining it and that, even if they failed, they would at least have given an impulse to the pacifist movement. The point of view of the German Socialists in regard to the Stockholm Conference was set forth in the Reichstag in a report of Herr Schiedemann on June 26. He said that the Stockholm negotiations had not taken the desired form in all respects. Everywhere attempts were being made to arouse distrust of the German Social Democracy whose members were described as war agitators in disguise and as mere tools of German Imperialism. He complained that the press everywhere misrepresented this peace movement on the part of the German Social Democrats. Nevertheless he believed that many misunderstandings on both

sides had now been removed and he concluded by saying that the government was wrong in offering bit by bit to the Russians more favorable terms for a separate peace; it should now prove to the world by its actions that it is sincere in its new attitude toward peace. In Great Britain (q.v.) the majority of the Labor and Socialist parties favored the sending of delegates to the conference, but the government was unwilling to grant passports; and the same was true of the attitude of the Socialist party and the government in the United States. See *WAR OF THE NATIONS, Diplomacy of the War*. At the close of the year discussion of the subject was going on in all the countries concerned.

**FRANCE.** The Socialist congress at Bordeaux in October showed that the views which in the beginning were held only by a minority were now the prevailing ones. Divisions in the party continued, however, in spite of the effort to bring about more complete unity. The meeting could not frame a resolution upon which all would agree. It passed a majority resolution and a minority resolution and there was an effort made by a group to amend the minority resolution. The main points indicating the attitude of each group are as follows:

The majority resolution declared for the Stockholm conference, for national defense, for voting the credits of the war and for conditional participation of Socialists in the government. The minority resolution declared that the Socialists were loyal to national defense but did not approve voting credits to the government if the war ceased to be a defensive war; and they declared in favor of a peace without annexations or indemnities. To this resolution the small group that represented the point of view of the Kienthal congress offered an amendment demanding that the Socialists in parliament should vote against any military credits in order to show their desire for an immediate peace without annexation. The majority resolution was carried by 1552 votes; and the minority by 831. The amendment showing the point of view of the Kienthal group received 118 votes, 85 being absent. The situation was about the same as it had been before. The aim of the congress, namely, to fuse the two principal groups into a solid mass, was not realized. On the other hand, there was no definite break. The majority resolution was very long and in some respects vague, probably for the purpose of offering a compromise which should draw as many votes as possible. As to the question of taking part in the government, the majority resolution did not take a final stand in that matter. It deferred to some later time the consideration of the principle, but it declared that the Socialist party did not refuse systematically to bear its part in responsibilities of government, provided that this participation followed a discussion of policy on the part of the prime minister with the Socialist members of parliament. Another part in the resolution was a programme amounting to the crisis of a war committee and the strict parliamentary control over the armies.

**GERMANY.** For two years German socialism had been divided into two groups. The majority under Schiedemann firmly supported the government. It did not concern itself with pacifist theories but gave its attention to internal reforms. It sought to realize the aims of so-

cialism in the economic field and to secure certain advantages in the way of democratic control. Following this course it did not wish to come in conflict with the government. The minority under Haase and Ledebour made up at first only a small fraction of the deputies. It was organized under the name of Independent Social Democratic Party. This group preached international socialism as in the past and remained loyal to the ideal of the class conflict. It appealed to the popular desire for peace in the hope of furthering a democratic programme. It did not believe in the value of concessions on the part of the government. Critics pointed out that as a matter of fact there was not at bottom much difference between these groups for they were above all German and they both played the game of the Imperial government. The main point of difference was that while the majority desired a peace honorable to Germany the minority insisted on an immediate peace which would make it possible for them to force the government to give way on certain points. The minority did not condemn the present war as a German war but it condemned war in general. Capitalism in all nations was, in their opinion, the real enemy.

**SPAIN.** In June the Socialist group at Madrid passed by a large majority a resolution, of which the main points were as follows: It condemned the work of the German agents in Spain and accused them of poisoning public opinion, and it declared the German Empire solely responsible for the war. It condemned the brutal methods employed by the Central Powers without regard to the laws of humanity and specifically the submarine activity of the Germans in Spanish waters. It declared that the German Empire treated Spain as if it were a hostile country and that, inasmuch as the Spanish government had taken no action towards supporting the German spy system and attacking the submarine policy, it seemed to the Allies to be an accomplice of Germany. While it was not the duty of the Socialist party to tell the government that the moment had come for breaking with Germany they would condemn the government both for injuries to the cause of the Allies and for the sufferings of the Spanish people if it did not take all the necessary measures. The Socialist party declared that the defeat of German Imperialism was not the only thing needful; it was equally necessary that the masses in all nations should work together for the destruction of imperialism everywhere in the world; it was also absolutely necessary that the masses of all countries should struggle to restore the International purged of those elements, which during the war had shown themselves unworthy. To do this as soon as possible was necessary in order to bring about the defeat of capitalism and the socialization of the means of production.

**SWITZERLAND.** The Swiss Socialist, Robert Grimm, who it was said early in the war had tried to bribe the Italian Socialists to maintain Italian neutrality and who was chief mover of the Kienthal and Zimmerwald conferences, appeared at the Stockholm conference as an advocate of peace. He was believed to be the spokesman of the German government, whose views were communicated to him by Mr. Hoffmann, member and at one time president of the Swiss Federal Council, who was then serving

as minister for foreign affairs. The incident as reported in the press was as follows: On June 5 the Swiss minister at Petrograd received from the home foreign office a telegram saying that Mr. Hoffmann authorized him to declare to Robert Grimm orally that Germany would not take the offensive so long as there seemed a possibility of coming to terms with Russia; and the minister was to add: "After conversations with an important personage I am convinced that Germany aims at a peace, honorable to both countries which would include close commercial and economic relations, and financial support that would place Russia on her feet, without any intermeddling with her internal affairs, also a complete accord on the subjects of Lithuania, Courland, and Poland, having regard to the racial character of the people. Germany would restore the occupied provinces, and Russia in return would give back the provinces she had taken from Austria-Hungary." On the publication of this telegram in a Stockholm newspaper, Mr. Hoffmann resigned, offering as an excuse for this action that he had taken it merely in his capacity as a private citizen.

**RUSSIA.** Before the war there were two marked tendencies in Russian socialism which may be called social revolutionary and social democratic. These tendencies appeared not only in theory but in practice. Starting out with entirely different assumptions they attained entirely different practical results. From the theoretical point of view the revolutionary Socialists started with a view of history as a result of human will—man's free will—and not a mere succession of material events. The Social Democrats on the contrary, in accordance with the doctrines of Marx, held the opposite view; that is to say, that historical events developed in accordance with the laws of evolution to which men must submit. According to the revolutionary Socialists, economic development in Russia must be made to take a different line from that which it had taken in western Europe. Western Europe was industrial and capitalistic; Russia was agricultural; therefore the basis of Russian socialism must be found in the agricultural working class. The Socialist ideal was the holding of land in common and in Russia this ideal was to be attained without passing through the industrial and capitalistic stage. The Social Democrats held the precisely opposite view; namely, that the economic development of Russia must proceed in the same manner as in western Europe. As to political tactics, they too differed. The revolutionary Socialists devoted themselves especially to the study of agricultural questions and they had become largely a party of small farmers and peasants. The Social Democrats opposed this programme and, acting on what they regarded as more purely Socialist ideas they gave all their attention to the industrial classes. See articles on countries mentioned; also **INTERNATIONAL PEACE AND ARBITRATION**; **NEW YORK**; **UNITED STATES**; **WAR OF THE NATIONS**.

**SOCIAL WORKERS, NATIONAL CONFERENCE OF.** See **CHARITIES**.

**SOCIETY OF CHEMICAL INDUSTRY.** See **CHEMISTRY, INDUSTRIAL**.

**SOCIOLOGY.** In addition to the matter be-

low, material of similar interest will be found under the following headings: SOCIAL ECONOMICS; POLITICAL ECONOMY; CHARITIES; LABOR; PENOLOGY; PROSTITUTION; and RELIEF FOR WAR VICTIMS.

**AMERICAN SOCIOLOGICAL SOCIETY.** The 12th annual meeting of this organization was held at Philadelphia, December 27-29. The general subject was "Social Control." The first session was held jointly with other bodies as described under Political Economy. The first special session was devoted to the general topic of "Agencies and Fields of Social Control," with addresses by Dr. S. P. Breckinridge, of the University of Chicago, Allen T. Burns, of the Cleveland Foundation, and Professor Carl Kelsey, of the University of Pennsylvania. The second general topic was "Primitive Social Control," with addresses by Professor Hutton D. Webster, of the University of Nebraska, Professor F. Stuart Chapin of Smith College, Dean J. E. Carter of Western Reserve University, and Professor Frank D. Speck of the University of Pennsylvania. On the general topic of "Social Control of Wealth," papers were prepared by Professor E. C. Hayes of the University of Illinois, and by Professor Carleton H. Parker of the University of Washington. Another session was devoted to the general topic, "Social Control of Immigration," with addresses by Professor H. P. Fairchild of Yale University, Miss Grace Abbott of the Children's Bureau, and Professor A. J. Todd of the University of Minnesota. The last special session was devoted to "Social Control of Political Relations" with the following papers: "A Social Control in a Democracy" by Professor F. H. Giddings of Columbia; "Social Control in International Relations" by Professor C. H. Cooley of the University of Michigan; and "How Far May Social Control in International Relations be Democratized," by Miss Jane Addams, of Hull House, Chicago. There was a final joint session with the Economic, Political Science, and Historical Associations with the following addresses: "The British Commonwealth," by R. H. Brand of the British War Mission; "The Pan-German Use of History" by Professor Wallace Notestein of the University of Minnesota; and "Economic Alliances" by Edward P. Costigan of the United States Tariff Commission. All the above addresses with discussions thereon will be published in the *Papers and Proceedings* in April, 1918. The society also coöperates in the publication of the *American Journal of Sociology*.

**SOUTHERN SOCIOLOGICAL CONGRESS.** The 6th annual session of this Congress met at Asheville, N. C., in August, with representatives present from 26 States. So widespread has become the interest in this conference and so extensive the scope of its activities that it has become a socializing force of the first importance throughout the entire South. It has assisted in creating a mutual understanding of the races; has stimulated every sort of movement for community betterment from the cleaning up of alleys to complete community programmes; has strengthened the activities of the Y. M. C. A. and Y. W. C. A., the rural church, and social centres; has forwarded the movement for labor legislation protecting women and children; has created an interest in co-operating activities in agriculture, dairying, poultry raising, and the marketing of farm prod-

ucts as well as the coöperation of consumers. The congress created special committees on "war-time relations to the man in uniform," and "relief and social work." In addition there was a thorough reorganization through the establishment of an executive committee and governing board, thus coördinating the various branches of interest. The congress also provided that J. F. McCulloch, its former executive secretary, should give his full time as educational secretary for the primary purpose of carrying on extension work. Special attention was given to the problem of negro migration. It was estimated that at least 250,000 negroes had gone north during the past year. It was indicated that this was due to bad economic conditions and increasing race friction, and numerous addresses dwelt upon the necessity of the two races coming together in conference for the purpose of reaching mutual understanding.

**THE SAGAMORE SOCIOLOGICAL CONFERENCE** was held in the closing days of June. The main topic was "Democracy and Business" but much attention was given to questions raised by the war. In an address on "Distribution and Democracy" Mr. William H. Ingersol declared that the wage earner is more widely exploited by our uneconomical system of distributing goods from producer to consumer than he is as an employee. The President of the Woman's Trade Union League, Agnes Nestor, made an address on "Conserving Our Human Resources"; Professor H. F. Ward, on "The Service Motive in the Business World." The former advocated putting humanity first in war appropriations and the latter favored the elimination of profit seeking in business and its replacement by the motive of social service. The resolutions of the congress favored the war in so far as it advanced the cause of democracy throughout the world and would result in the intensification of altruistic as over against selfish motives for activity.

**SOILS.** In his attempts to respond to the patriotic appeal for increased food production with insufficient and high-priced fertilizer and in many cases shortage of labor, the farmer has realized as perhaps never before the importance of careful adaptation of crops to soils and of close study of the actual fertility deficiencies and requirements of soils. The accurate knowledge on this point accumulated during many years was put to good use since the great war began, and especially during the year 1917, in increasing food production.

For this purpose the soil surveys were of great value. In many countries these were temporarily discontinued or were continued in a less thorough and systematic way than formerly. In the United States, however, such work progressed without interruption and with increased thoroughness and activity. During the year ended June 30, 1917, the U. S. Bureau of Soils, coöperating with State institutions, surveyed and mapped the soils of 81 areas in 32 States, aggregating 37,225 square miles, or 23,824,000 acres of land. This was about one-fourth of the strictly agricultural area of the United States. In addition, reconnaissance surveys were made of two areas of desert and mountainous regions in one State, aggregating 9182 square miles or 5,876,480 acres, bringing the total area so surveyed up to 493,494 square miles or 315,836,160 acres.

Realizing the necessity for making the greatest possible practical use of these surveys, a careful study was being made of them to determine the soil most productive of the staple crops. Special attention was given during the past year to questions regarding garden soils growing out of the agitation for so-called "war gardens." The value of these surveys from the farmer's standpoint was greatly increased by the fact that they combined broad knowledge of soil conditions over a wide area with specific information regarding local conditions and needs.

Rather comprehensive studies were made of certain soils of South Africa, especially of Rhodesia, Belgian Congo, and Cape Province, with reference to their deterioration as a result of diminished water and nitrogen supply, erosion, and other causes. The general conclusion from these and similar studies in India was that lack of adequate water control was the major factor in the deterioration of these lands. This was a condition which is so widespread and serious as fully to justify the large amount of attention which was being given to investigations on the movement and control of soil water.

Special emphasis was being placed on simple, practical means of quickly increasing the productiveness of soils, such as better use of manure judiciously supplemented with fertilizers, drainage, correction of acidity by liming, good tillage, and rational rotation. The problem was complicated somewhat by the shortage of potash. This made it necessary to increase if possible the availability of the potash already in the soil by such means as adding organic matter, deep and thorough tillage, and liming.

The reclamation of waste lands was receiving special attention in regions where the arable area was restricted, as, for example, in England. The matter was of less immediate importance in the United States. Nevertheless, there were

certain minor but widespread phases of reclamation, such as drainage of wet spots in otherwise productive fields and correcting acidity by liming, which in the aggregate constituted a major item in agricultural production.

Renewed attention was given to the practical advantages of partial sterilization as a means of restoring the productiveness of "sick" soils. The treatment of field, garden, and greenhouse soils with antiseptics such as toluene, carbon bisulphide, formalin, and the like lately had been tried in France with distinctly beneficial results and with indications that such treatment was of practical value. Russell reported that partial sterilization by steam heating was extensively practiced in England by market gardeners "both as a cure for sick soils and as a method of killing the soil insects and fungoid pests that cause so much havoc." It also saved the expense of frequent renewal of the greenhouse soils.

Soil acidity continued to receive much attention by investigators, but no exact test for acidity and lime requirement had been discovered, although this was looked upon as one of the most important laboratory tests from a practical standpoint. Acidity had been shown to be due to diverse causes not exactly determinable in all cases by one method. Acid soils had been shown to respond well to insoluble phosphates like raw rock phosphate or bone meal. They would not, however, grow the more important nitrogen gatherers (leguminous crops). The popular belief that green manures increase the soil acidity to any harmful extent had been shown to have no foundation in fact.

It had been shown that loss of sulphur from soil may be a very important factor in the decline of productivity and may become a limiting factor sooner than loss of phosphorus. Sulphur, as well as phosphorus, is required especially by legumes. Hence a normal growth of legumes indicates a sufficient supply of sulphur and phosphorus in the soil.

The beneficial effect which has frequently been noted when soluble iron salts have been added to the soil was explained as due to the fact that the iron normally present in soil is very insoluble and can not be assimilated in sufficient amounts by plants, especially in soils containing large amounts of lime. To be effective, however, the soluble iron salts must be applied close to the plants since they are quickly fixed and rendered insoluble.

There was considerable recent investigation tending to show that maintaining a soil mulch by surface cultivation was not as effective as had been supposed in preventing evaporation and promoting nitrification, and that the beneficial effect observed is mainly due to the destruction of weeds. If this proves to be generally true it would warrant the discontinuance of a large amount of expensive tillage.

**SOMALILAND, ITALIAN.** See **ITALIAN SOMALILAND**.

**SOMALILAND PROTECTORATE.** A British protectorate on the Gulf of Aden. Area, about 68,000 square miles; population (1911), 302,859, largely nomad Mohammedan tribes. Berbera, Bulhar, and Zeila are the chief ports. Live stock constitutes the wealth of the country. Imports amounted in 1913-14 to £238,218;

exports, £216,590; revenue, £29,646; expenditure, £68,646; grant-in-aid (1912-13), £26,000.

**SOMME.** A river in France. See **WAR OF THE NATIONS, Military Operations (3).**

**SOUTH, UNIVERSITY OF THE.** A Protestant Episcopal institution for the education of men, located at Sewanee, Tenn. In the fall of 1917 there were 154 students and 28 members of the faculty; more than one-third of the 1916-17 student body joined the colors. Volumes in the library numbered 37,504. Productive funds in 1917 amounted to \$436,367. The university was founded in 1857. President and vice-chancellor, Rt. Rev. Albion W. Knight, D.D.

**SOUTH AFRICA, UNION OF.** A British colony; a legislative union, under one government, of four provinces. Their areas, according to latest returns, total population, and their white population, with area and population of annexed territories, are shown in the following table:

	Sq. Miles	Total Pop.	Whites
Cape of Good Hope.....	206,860	1,553,630	546,162
Bechuanaland .....	51,524	99,553	14,917
Transkelan Territories:			
East Griqualand .....	7,594	249,088	7,950
Tembuland .....	4,129	236,086	8,138
Transkei .....	2,552	188,895	2,189
Pondoland .....	3,906	234,637	1,383
Walfish Bay .....	430	637	32
<b>Total Cape Province...</b>	<b>276,995</b>	<b>2,564,965</b>	<b>582,377</b>
Natal .....	24,866	974,437	95,994
Zululand .....	10,424	219,606	2,120
<b>Total Natal .....</b>	<b>35,290</b>	<b>1,194,043</b>	<b>98,114</b>
Transvaal .....	110,426	1,686,212	420,562
Orange Free State....	50,889	528,174	175,189
<b>Total Union of South Africa .....</b>	<b>473,100</b>	<b>5,973,394</b>	<b>1,276,242</b>

The Bantus numbered 4,019,006 (2,022,949 males and 1,996,057 females), or 67.28 per cent of the total population; mixed and other colored, 678,146, or 11.35 per cent. Cape Town, the seat of the Union Parliament, had, with suburbs, 161,759 inhabitants (of whom 85,442 white); Johannesburg, 237,104 (119,953); Pretoria, 57,674 (35,942); Durban, 89,998 (34,880); Port Elizabeth, 37,063 (20,007); Kimberley and Beaconsfield, 44,433 (17,507); Germiston, 54,325 (15,579); East London, 24,606 (14,899); Pietermaritzburg, 30,555 (14,737).

**MINING.** The operation of the mines was generally normal throughout 1916. Although many kinds of supplies were obtained with difficulty and many checks due to the war had to be met, the industry was carried on without any critical interruptions. A shortage of native labor and the employment of new natives in August and September slightly checked work during those months. The increased cost of production is attributed by engineers and mining experts partly to the rise in prices of mining supplies and to unprecedented ocean freight rates; to the large sums paid out as allowances to employees on active war service; and to war bonuses allotted to regular workers.

**Gold.** The gold produced in the Transvaal amounted in 1916 to 9,295,538 ounces. This is an increase over 1915, the return being the highest ever recorded for any one year. At the close of 1916 the Transvaal gold fields had produced 121,219,666 ounces of gold since 1884. The amount milled on the Witwatersrand for 1916

was 28,525,252 tons, 200,000 more than in the preceding year. Employed in the gold mines in December, 1915, were 23,069 white and 223,764 colored laborers, of whom 23,048 white and 223,692 colored were engaged in the Transvaal. The table below shows the output by provinces in 1912 and 1915:

	Fine Ozs.		Pounds Sterling	
	1912	1915	1912	1915
Trans. ....	9,107,512	9,093,902	38,686,250	38,628,437
Natal ...	1,242	2,461	5,276	10,453
Cape ....	38	48	162	205
<b>Union.</b>	<b>9,108,792</b>	<b>9,096,411</b>	<b>38,691,688</b>	<b>38,639,095</b>

Extensive development of sections of the untouched areas of the Witwatersrand is projected. The government mining engineer states that there is available for leasing on proclaimed ground a total area of 16,842 claims. When the remainder of the reef-bearing land is proclaimed, amounting to 64,863 claims, about 48,000 claims will become available for leasing, bringing the total approximately to 65,000 claims, of which 49,200 claims contain reef at a depth of less than 5000 feet.

**Diamonds.** The Department of Mines states the diamond production for the Union during 1916 at 2,346,330 carats; output in 1913, 5,163,547 carats; in 1912, 5,071,882 carats. The total production from mines was 2,170,348 carats; alluvial workers recovered 167,620 carats. The value per carat exceeded all values obtained per carat during the last five and one-half years. In December, 1915, 3324 whites were employed in the diamond mines and 8152 colored. The table below shows the output by provinces in 1912 and 1915:

	Carats		Pounds Sterling	
	1912	1915	1912	1915
Trans. ....	2,131,406	35,674	2,386,979	128,067

O. F. S. ..	614,927	1,241	1,483,544	5,545
<b>Union...</b>	<b>5,071,882</b>	<b>103,386</b>	<b>10,061,489</b>	<b>399,810</b>

**Coal.** An improvement took place in the coal industry during 1916. The total production was 8,281,324 tons in 1915 and 10,007,473 tons in 1916, when 6,136,913 tons came from the Transvaal. The year began with a scarcity of coal cars. Of the 27,000 trucks now in service, approximately 25,000 have been adapted to coal traffic. The failure of the railroads to anticipate the rapid development of the industry occasioned loss to both producer and carrier.

The price of Transvaal coal remained at about the same level throughout 1916 at the port of Cape Town; it rose 24 cents a ton at Durban. The increased demand for fuel caused the Transvaal Coal Owners' Association to refuse to renew its contracts with the railways to supply coal at the old prices. When they were unable to obtain sufficient quantities from the non-associated collieries, the railroads compromised upon an advance of 12 cents per ton; they were more than compensated by an advance in freight rates on coal between certain points. The added importance of this industry is due largely to the abandonment of the Suez Canal route by several of the principal steamship lines in favor of the voyage around the Cape of Good Hope. The large coal deposits in South Africa

may influence the maintenance of the present route and encourage shipping to touch at Union ports and to engage in South African trade.

White and colored labor employed in coal mines, 1274 and 24,595 respectively. The table below shows the output by provinces in 1912 and 1915:

	Tons *		Pounds Sterling	
	1912	1915	1912	1915
Trans. . .	4,751,850	5,202,805	1,044,986	1,145,060

Union. . .	8,117,078	8,281,324	1,999,378	2,142,479

\* Tons of 2000 lbs.

**Other Minerals.** The total output of copper in the Union amounted to 28,970 tons in 1915 and 22,862 tons in 1916. The Transvaal yielded 14,996 in 1915 and 12,244 tons in 1916. In the Transvaal in 1916 were produced 3263 tons of tin.

**AGRICULTURE.** Drought continued throughout the 1916 growing period, and cereals were injured. The wheat crop, estimated by the Department of Agriculture at 1,437,000 bags (200 pounds net weight) for the whole of the Union of South Africa, was 26 per cent below that of 1915. The yield in the Transvaal was 24 per cent below normal and in some districts of the Orange Free State it was almost a complete failure. The oat crop was about 51 per cent less than the average in the Transvaal and 22 per cent in the Orange Free State; barley (Union), 14 per cent. Of the yield of corn for the Union in 1915 (10,250,000 bags), the Transvaal and the Orange Free State produced 3,930,926 and 2,123,369 bags, respectively. In 1916 the Union produced 7,056,118 bags. The tobacco crop was estimated by the department at approximately 7,000,000 pounds. Large areas, especially the Transvaal, Swaziland, and Zululand, are adapted to cotton growing. An increased acreage in 1916 indicated the development of the industry. The crop for the 1915-16 season amounted to 500,000 pounds of seed cotton; the 1916-17 crop was expected to yield 1,000,000 pounds. The acreage, said to be more than double that of any previous year, is placed at 7000, of which 4000 acres are in the Rustenburg district, 2000 in the Waterburg, 500 in the Pietersburg, and 500 in other districts not specified.

**MANUFACTURES.** The following statistics are contained in an article in the *Johannesburg Rand Daily Mail*: Official publication has been made of preliminary tables giving in summary form the principal results of the census of factories and productive industries in the Union for the business year 1915-16. The final results show approximately a gross production at all establishments, excluding railway workshops, of £36,000,000; railway workshops, £4,300,000. The total number of separate factories making returns in the Union is 4047, of which 2006 are in the Cape, 604 in Natal, 1153 in the Transvaal, and 284 in the Orange River Colony. The capital returned as invested in the various provinces was: Cape, £14,941,000; Natal, £10,657,000; Transvaal, £17,533,000; Orange River Colony, £2,334,000; total, £45,465,000.

The average numbers of white persons em-

ployed were: Cape, 14,554 males and 2292 females; Natal, 6058 and 626; Transvaal, 12,085 and 1124; Orange River Colony, 1582 and 522; total, 34,279 and 4564. Of the native races, 33,855 males and 383 females are employed in the Union; Asiatics, 10,081 males, 1106 females; other colored, 11,839 males and 3327 females; making in all 90,054 males and 9380 females, or a gross of 99,434. Of the native males the Transvaal leads with 18,550, while Natal has the largest number of Asiatics, with 1095 males and 1095 females. The Cape has a preponderating number of other colored, with 10,656 males and 3238 females. The wages that are paid show largely in favor of the Transvaal. The returns are: Cape, £2,062,000 for white labor and £20,000 for colored; Natal, £1,172,000 and £487,000; Transvaal, £3,110,000 and £673,000; Orange River Colony, £289,000 and £68,000; total, £6,633,000 and £1,248,000. The cost of fuel and light returned in each province was: Cape, £268,000; Natal, £192,000; Transvaal, £722,000; Orange River Colony, £45,000; total, £1,227,000.

In the Union there were 1214 establishments using electricity to the extent of 121,229 horsepower, 689 using 564,664 horsepower with steam, 440 using 5985 horsepower with oil, 181 using 6266 horsepower with gas, and 152 using 3759 horsepower with water. The Transvaal has 430 establishments using 84,634 horsepower, electrical; 226 using 294,956 horsepower, steam; 63 with 500 horsepower, oil; 36 with 1224 horsepower, gas; and 23 with 1387 horsepower, water.

**COMMERCE.** The total value of the imports and exports of the trade of the Union, exclusive of specie, is shown in the table below, for three comparative years:

	1913	1915	1916
Imports . . .	£41,828,841	£31,810,717	£40,399,945
Exports . . .	66,569,364	16,684,991	23,759,191

A table of the principal imports for home consumption, and exports of domestic produce, in the 1916 trade, follows, values in thousands of pounds sterling:

Imports	£1,000	Exports	£1,000
Foodstuffs . . . . .	5,809	Corn . . . . .	5,280
Cotton mfrs. . . . .	5,355	Diamonds . . . . .	6,602
Apparel . . . . .	2,882	Wool . . . . .	436
Hardware . . . . .	1,896	Feathers . . . . .	2,311
Leather mfrs. . . . .	1,709	Coal . . . . .	2,832
Machinery . . . . .	2,189	Hides and skins . . . . .	1,116
Haberdashery . . . . .	1,227	Mohair . . . . .	980
Iron and steel . . . . .	1,233	Copper . . . . .	257
Wood, etc. . . . .	1,002	Bark . . . . .	239
Drugs, etc. . . . .	1,164	Tin ore . . . . .	161
Oils . . . . .	1,108	Explosives . . . . .	877
Furniture . . . . .	518	Fish . . . . .	529
Glycerine . . . . .	875	Meats . . . . .	387
Woolen mfrs. . . . .	954	Tobacco . . . . .	120

In the table of countries of origin and destination below it is of interest to note the large import trade which this country has developed with Japan under war conditions. The commissioner of customs and excise stated in his report that a regular steamship service has been established between Japan and South Africa; during 1916, 100 Japanese vessels, with a tonnage of 430,229, called at Union ports, as compared with 7 vessels, of 19,875 tons, during 1915.

There was a considerable increase in both the import and the export trade with the United States in 1916, due chiefly to the cutting off of

commerce with other countries on account of the war. Although the declared value of the goods imported constitutes a record, the actual volume in tonnage is considerably below the figure for some recent years. The average increase in value for 1916 over 1913 is 22.4 per cent, but the volume of imports in 1916 was 22 per cent less than in 1913.

## IMPORTS AND EXPORTS, 1916

During 1916, 1789 vessels, of 5,933,234 tons net, were entered, and 1782 vessels, of 5,765,921 tons, were cleared.

COMMUNICATIONS. On December 31, 1915, the mileage of the government railway lines totaled 8924, of which 8404 miles were of 3-foot 6-inch gauge, and 520 miles of 2-foot gauge. Of the total mileage, 3964 miles were in the Cape province, 2492 in the Transvaal, 1265 in the Orange Free State, 1203 in Natal. Capital expenditure to end of 1915, £71,949,398, plus £15,040,642 in respect of rolling stock—a total of £86,990,040 (besides £1,081,666 for new construction during the year). Gross earnings for the year, £12,197,980; net profit after payment of interest, £1,310,380. Working expenditure, including renewals, £7,499,306, or 61.5 per cent of the gross revenue. At the end of 1915, 641½ miles of new line were under construction. At the end of 1916 the mileage in operation was reported to have increased to 9419.

FINANCE. The banking returns indicate the soundness of the country's commercial position. Credit after two and a half years of war is still apparently very good, and no serious setback is now anticipated. The profits earned by the banks in 1916 were well maintained, and the following dividends were declared: African Banking Corporation, 6½ per cent; National Bank of South Africa, 6 per

cent; Netherlands Bank of South Africa, 4 per cent; Standard Bank of South Africa, 14 per cent; Stellenbosch District Bank, 12 per cent. In the table below are shown budget estimates:

	1914-15	1915-16	1916-17
Revenue .....	£15,323,185	£17,690,536	£18,300,000
Expenditure ..	17,328,296	17,487,456	17,900,000

The total public debt stood, March 31, 1916, at £150,832,734.

GOVERNMENT. The four original provinces form a legislative union under one head—a governor-general appointed by the crown, who, with an executive council (whose members are chosen by him), administers the country as the governor-general in council. The Senate consists of 40 members (8 nominated by the governor-general in council; 32 elected, 8 for each province). The House of Assembly consists of 130 elected members—51 from the Cape of Good Hope, 17 from Natal, 45 from the Transvaal, and 17 from the Orange Free State. Pretoria (Transvaal) is the capital and administrative seat of the executive government; Cape Town is the seat of the legislature. The governor-general in 1917 was Viscount Buxton of Newtimber. Gen. Louis Botha, premier since May 31, 1910, resigned December 14, 1912, on account of dissensions between the Dutch and the British on naval and other matters; but he again took office in the same year as premier and minister of agriculture, and in October, 1913, as premier and minister for native affairs. The Union government has taken over the administration of Southwest Africa (formerly German Southwest Africa, a German colony). The railways of that country have been connected with the Union lines, and the entire system is regulated by the general manager of the South African Railways. British steamers call occasionally at the ports, but most of the goods intended for that country are being carried by the railways.

HISTORY. At the beginning of the year the military situation was such as to permit Gen. Smuts to leave his command and accept the invitation to represent the government of the Union of South Africa at the Imperial War Conference. When Gen. Smuts had assumed command in February, 1916, a portion of the British territory and all of German East Africa were in the hands of the enemy. By January, 1917, only part of German East Africa (q.v.) remained in German hands. According to newspaper accounts the political situation in South Africa at the beginning of the year continued to be peaceable. It was expected that the truce between Gen. Botha and the Unionists would be maintained. The Nationalists, who opposed the ministry, advanced the argument that the independence of South Africa was endangered by this close union with the empire. Their attacks upon this policy were most violent, but in two critical by-elections they were defeated by Gen. Botha. It was further reported that they were divided among themselves and that they were further weakened by the protest of neutral powers against German war methods. They had much to say about the interference of the Imperial Government with the rights of South Africa. On June 14 Lord Buxton, the governor-general, declared that there was no such danger of interference and that if such anxiety was real there was no foundation for it. Certain

Nationalists criticized this speech as itself an interference with party politics and declared that the people would not submit to any interference from overseas either by the government or by its representative. On June 15 Gen. Botha warned the members of the South African party not to be misled by a false movement for independence, declaring that to make any such attempt as this at the present moment was unjust and dishonorable. The South African party congress held its opening session at the end of September. The prime minister, Gen. Botha, in the course of a speech in which he emphasized the fact that the Allies did not want the war, said that the only thing to do was to fight it through to a victory. He condemned the Nationalists for their apparent wish to break down the party constitution which they had helped to draft. The congress passed a resolution expressing its readiness to come to some better understanding with the National party on the basis of first, the maintenance of the Union Constitution; second, the fulfillment of the obligations connected therewith; and third, the maintenance of the South African party principles. The attitude of the Nationalists was illustrated by the speeches of prominent members at the congress of Free State Nationalists at Bloemfontein at the end of September. The government's policy in aiding Great Britain in the war had, according to them, brought about a spirit of discontent that was almost revolutionary. Ultimate independence of Great Britain was desirable and inevitable. Nevertheless, there was no disposition to push the matter at present. The time did not seem ripe for carrying on republican propaganda and as to another rebellion, that was not possible, and was brought up by the enemies of the Nationalists in order to discredit them. They declared that their party had increased in numbers to such an extent that should an election be held at once its representation in the House of Assembly would be doubled.

**SOUTH AMERICA.** See the articles on the various South American countries.

**SOUTH AUSTRALIA.** A State of the Commonwealth of Australia. It occupies the central and southern part of the continent, lying south of the Northern Territory and between Western Australia on the west and Queensland, New South Wales, and Victoria on the east. The State has an estimated area of 380,070 square miles, which is about 12.8 per cent of the area of the Commonwealth or nearly equivalent to the combined area of California, Nevada, and Arizona. Estimated population June 30, 1916, 433,563, as compared with 438,195 in 1915 and 408,558 at the 1911 census (these figures being exclusive of full-blooded aborigines). The capital is Adelaide; its population, including suburbs, was 189,646 in 1911; as estimated in 1915, 205,000.

The legislative power is vested in a parliament of two chambers, the Legislative Council and the House of Assembly. The council consists of 20 members, elected for 6 years; the Assembly of 46 members, elected for 3 years. South Australia was the first of the States to adopt woman suffrage; the franchise was exercised by women for the first time in Australia at the Assembly election, April 25, 1896. The executive authority rests with a governor, who is appointed by the crown and acts through a

responsible ministry. The governor in 1917 was Lieut. Col. Sir Henry Lionel Galway, K.C.M.G., D.S.O., who assumed office in 1914. Premier, A. H. Peake (coalition ministry formed August 28, 1917). See AUSTRALIA.

**SOUTH CAROLINA. POPULATION.** The population of the State in 1910 was 1,575,400, and on July 1, 1917, it was estimated to be 1,643,205.

**AGRICULTURE.** The acreage, production, and value of the principal crops, as estimated by the United States Department of Agriculture in 1916-17, were as follows:

		Acreage	Prod. Bu.	Value
Corn ....	1917	2,313,000	43,947,000	\$84,373,000
	1916	2,065,000	32,008,000	36,169,000
Wheat ...	1917	175,000	1,838,000	5,330,000
	1916	210,000	2,226,000	4,207,000

**TRANSPORTATION.** The total steam railroad mileage for the year ending December 31, 1917, was 3744.29 miles, of which 102.45 miles is double track. The railroads having the longest mileage were as follows: Southern Ry. Co., 1128 miles; Atlantic Coast Line, 919 miles; Seaboard Air Line, 767 miles.

During the year the Seaboard Air Line Co. completed and had in operation a new extension between Charleston, S. C., and Savannah, Ga., of 95 miles, 90 miles of same being in South Carolina. There was constructed 30.12 miles of double track.

**FINANCE.** The report of the State treasurer for the fiscal year of 1917 shows a balance on hand at the beginning of the year of \$656,683. The receipts during the fiscal year were \$4,687,958, and the expenditures \$4,381,552, leaving a balance on hand on December 31, 1917, of \$963,089. The State's bonded debt of \$5,382,059 is valid.

**EDUCATION.** The total enrollment in the public schools of the State in 1915, the latest for which statistics are available, was as follows: White, 180,316 negro, 192,625, or a total of 372,841. The average daily attendance in schools for the white children was 123,118, and for the negro children 127,567, or a total of 250,685. The total number of white teachers was 5072, and of negro teachers 2998, or a total of 8070. The total school revenue for the year was \$4,039,382, and the total expenditure \$3,925,506. The average yearly salary paid to male teachers was \$594.72, to women teachers \$340.54; to negro male teachers, \$127.77, and to negro women, \$106.83.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the State Hospital for the Insane, Confederate Infirmary of South Carolina, South Carolina School for the Deaf and Dumb, the State Penitentiary at Columbia, the State Reformatory for Negro Boys at Columbia, and the State Farm at Boykin.

There is also a State Tuberculosis Hospital and an Industrial School at Florence, but the former is not a charitable institution.

**STATE OFFICERS.** Governor, Richard I. Manning; Lieutenant-Governor, Andrew J. Bethea; Secretary of State, W. Banks Dove; Attorney-General, Thos. H. Peeples; Treasurer, S. T. Carter; Comptroller, C. W. Sawyer; Superintendent of Education, John E. Swearingen; Adjutant-General, W. W. Moore; Commissioner of Agriculture, Dr. A. C. Summers; Commissioner of Insurance, F. H. McMaster—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Eugene B. Gary; Justices, D. E. Hydrick, R. C. Watts, Thos. B. Fraser, and Geo. W. Gage; Clerk, U. R. Brooks.

**SOUTH CAROLINA, UNIVERSITY OF.** A non-sectarian co-educational institution located at Columbia, S. C. It was founded in 1805 and since 1878 has been divided in two branches, the South Carolina College, at Columbia, and the Claffin College for Negroes at Orangeburg. In the fall of 1917 there were 352 students and 42 members of the faculty. Dr. L. P. Chamberlayne, of the ancient language department, died in 1917. Volumes in the library numbered 60,000. President, W. S. Currell.

**SOUTH DAKOTA, POPULATION.** The population of the State in 1910 was 583,888, and on July 1, 1917, it was estimated to be 716,972.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17, were as follows:

		Acreage	Prod. Bu.	Value
Corn	1917	3,850,000	97,150,000	\$116,580,000
	1916	2,950,000	84,075,000	64,738,000
Wheat	1917	3,716,000	52,024,000	101,967,000
	1916	3,650,000	24,825,000	37,237,000
Oats	1917	1,935,000	65,450,000	39,924,000
	1916	1,850,000	56,425,000	25,856,000
Potatoes	1917	80,000	7,200,000	7,992,000
	1916	65,000	4,290,000	5,877,000
Hay	1917	735,000	1,102,000	11,681,000
	1916	750,000	1,425,000	7,695,000

a Tons.

**MINERAL PRODUCTION.** The total value of the production of gold, silver, and lead in 1916 was \$7,604,692, an increase of \$96,910 over the yield of 1915. The total output of gold was 360,909 fine ounces, valued at \$7,460,644.

The gold production of the State in 1917 was \$7,412,000, compared with \$7,460,644 in 1916. The silver produced was 193,000 ounces, compared with 215,205 ounces in 1916. There was a small quantity of lead produced from smelting ores shipped. It amounted to 88,000 pounds.

**TRANSPORTATION.** The total length of lines operated in the State on December 31, 1916, was 4285. The lines having the longest mileage were: The Chicago, Milwaukee, and St. Louis, 1799, and the Chicago Northwestern, 1065.

**FINANCE.** The treasurer's report for the fiscal year ending June 30, 1917, showed cash on hand, July 1, 1916, to the amount of \$1,042,763. The receipts for the year amounted to \$5,039,158, and the disbursements to \$4,108,427, leaving cash on hand on June 30, 1917, to the amount of \$1,973,504.

**EDUCATION.** The total school population in 1917 was 178,946.

**CHARITIES AND CORRECTIONS.** The charitable

and correctional institutions include the School for the Deaf and Dumb, School for the Blind, Northern Hospital for the Insane, the Custer Sanatorium, and the State School for Deaf Mutes, at Sioux Falls.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below: Provision was made for the budget system for the preparation and enactment of annual improvements. The office of State sheriff was created. The city manager plan of government was approved. Provision was made for the voting of citizens absent from the State in the national service. There was initiated an unusual primary law. By its provisions party campaign pamphlets are to be printed by the State. Candidates for president and governor within the party, must appear in one to sixteen joint debates, respectfully, within the State, or cease to be candidates. An independent candidate may file a "paramount issue" of eight words or less with the secretary of State. This issue will appear on the ballot, and the independent candidate must challenge the representative candidate to joint debate on it. An elected candidate who fails to observe the principles on which he was elected, or is guilty of misconduct, may be recalled by a party jury. A prohibition law, effective February 21, 1918, was passed. Laws relating to wages and hours of labor were amended. A workman's compensation law was passed. A constitutional amendment was proposed authorizing the creation of the hail insurance fund. Land owners are permitted to form drainage districts of geographical lines. Provision was also made for the formation and regulation of irrigation districts. Laws relating to taxation were amended in important details. Several laws relating to eugenics were passed. The banking laws of the State were amended. A special commission was appointed to make a survey of the educational system and to study the school laws and make recommendations for changes therein. The Supreme Court, on January 22, held the so-called "Blue Sky" law constitutional.

**STATE OFFICERS.** Governor, Peter Norbeck; Lieutenant-Governor, W. H. McMaster; Secretary of State, Frank M. Rood; Treasurer, G. H. Helgeson; Superintendent of Public Instruction, Chas. H. Lugg; Attorney-General, C. C. Caldwell; Adjutant-General, W. A. Morris; Auditor, J. F. Handlin; Commissioner of Schools and Public Lands, N. E. Knight; Commissioner of Insurance, W. N. Van Camp—all Republicans.

**JUDICIARY.** Supreme Court: Presiding Judge, John Howard Gates; Justices, Charles S. Whiting, E. G. Smith, James H. McCoy, Samuel C. Polley; Clerk, E. F. Swartz.

**SOUTH DAKOTA, UNIVERSITY OF.** A co-educational State institution located at Vermilion, S. D. In the fall of 1917 there were 660 students and 70 members of the faculty. Volumes in the library numbered 35,000. Income from productive funds in 1917 amounted to \$170,000. There is in course of construction a new women's building to cost \$125,000 and new engineering shops to cost \$25,000. The university was founded in 1883. President, Robert L. Slagle.

**SOUTH DAKOTA STATE COLLEGE OF AGRICULTURE AND MECHANICAL ARTS.** A co-educational State institution located at

Brookings, S. D. In the fall of 1917 there were 20 students and 75 members of the faculty. Volumes in the library numbered 20,000. Productive funds in 1917 amounted to \$390,941 and the income therefrom to \$40,979. The college was founded in 1881. President, E. C. Perisho.

**SPAIN.** A constitutional monarchy in southwestern Europe, occupying the greater part of the Iberian Peninsula. It is separated from France by the Pyrenees. The capital is Madrid.

**AREA AND POPULATION.** The country, anciently made up of fourteen kingdoms, is now separated into provinces. The area of these provinces totals 504,547 square kilometres (194,794 square miles), and their population, as calculated December 31, 1914, 20,500,287 (18,607,874 in 1900).

There were, in 1915, 127,870 marriages, 614,704 births, 452,450 deaths, 50,359 emigrants. Some of the principal cities, with their communal population, are: Madrid, 599,807; Barcelona, 587,411; Valencia, 233,348; Sevilla, 158,287; Málaga, 136,365; Murcia, 125,057; Saragossa, 113,729; Cartagena, 102,542; Bilbao, 93,536; Granada, 80,511; Lorca, 70,807; Valladolid, 71,066; Palma (Balears), 67,544; Cádiz, 67,174; Córdoba, 66,831; Santa Cruz de Tenerife, 63,004; Santander, 65,046; Las Palmas (Canarias), 62,886; Jerez de la Frontera, 62,628; Alicante, 55,300; Gijón, 55,248; Oviedo, 53,269; San Sebastián, 49,008.

**PRODUCTION AND SUPPLIES.** Frequent reports came during 1917 from Spain of widespread unrest because of her attitude toward the war; and an almost universal food shortage culminated in a general strike. The government, March 29, announced the suspension of constitutional guarantees and closed the "People's House" and other labor centres. The next day a censorship was established "to prevent the dissemination of alarmist news."

A law has recently been passed for state support of agricultural and allied industries. In a report on the project, the British *Board of Trade Journal* says: "Farming on a large scale is not general in Spain; and, as the land is largely cultivated by peasants, the market for labor-saving machinery is not an important one. The total value of imports of agricultural machinery and implements into Spain during the last pre-war year, amounted to about £225,000, of which the United Kingdom's share was £48,000.

"It is improbable that any important improvements in agriculture in Spain will be introduced in the near future. Such assistance to the industry as may at first be given will very likely take the form of coördination of the means of transport, so as to enable produce to be marketed more economically. A step forward, however, was taken in July, 1917, when a law was passed for the formation of a Central Agricultural Loan Bank, in which the state proposed to stimulate coöperation, to carry on educational work (making use, when feasible, of existing organizations), to provide capital, and to urge banks to grant financial assistance. This bank is now to be established, and will have for its object the propagation of the principles of co-operation, and the granting of assistance, financial and otherwise, to coöperative societies. The bank will have an initial capital of 10,000,000 pesetas (£400,000 at par exchange)."

The question of the wheat supply grew in

importance with the continuance of the war. The government adopted measures to prevent storage of grain by which the holders would be enabled to exact excessive prices. It encouraged the importation of foreign wheat by advancing to millers in the ports funds for paying cash, and reduced the freight rates so as to bring the cost price of wheat on the wharf to \$2.95 per 100 pounds for wheat from the United States and Argentina and \$3.10 per 100 pounds for Manitoba wheat.

The wheat supply during 1916 was affected by the difficulty of securing ships for importing it and by the rise in price at the foreign ports of origin. In January, 1916, the import duty was removed and exports were taxed. The government, by a law enacted in February, 1915, and amplified in November, 1916, was empowered to acquire and sell articles of primary necessity, controlling the distribution and selling price of such provisions.

The annual consumption of wheat in Spain is estimated at 4,200,000 metric tons, of which 3,600,000 tons are devoted to bread making, and 600,000 to seeding and the manufacture of macaroni and other alimentary pastes. In 1913 and 1914 most of the wheat imported came from Russia and Rumania; in 1915 and 1916 the United States supplied more than two-thirds, sending 248,115 and 235,708 metric tons, respectively. The total imports of wheat into Spain were 174,311 metric tons in 1913, 422,613 in 1914, 371,425 in 1915, and 313,408 in 1916.

In the table below are given areas under main crops and yield for two years:

	Hectares		Quintals	
	1917	1916	1917	1916
Wheat ...	4,187,854	4,106,952	38,398,198	41,457,516
Rye .....	728,544	746,987	6,189,177	7,810,998
Barley ....	1,658,715	1,572,627	16,708,782	18,912,418

\* Yield in seed. † For sugar. ‡ Yield in hectolitres of must.

The year 1916 was a prosperous year for grape growing. The district of Catalonia led with 1,112,650 tons, followed by Mancha and Estremadura with 589,236 tons, Levante with 551,380 tons, and New Castile with 486,397 tons.

Exporters in 1916 disposed of 117,450,192 gallons of wine of all kinds, compared with 43,244,699 gallons in 1915. Shipments of ordinary red wine increased nearly threefold in 1916 over 1915, more than 80 per cent going to France, while the amounts sent to England and America were less than in the previous year. Exports of rich sherry and amontillado were more than double those of 1915, 28 per cent going to France. Twenty-five per cent more of other dessert wines was exported than the year before, the increase being due almost entirely to French imports, which in 1916 were about five times as great as in 1915. Shipments of these wines to England and America showed a marked decline. Malaga wine exports increased by nearly 50 per cent, those to France being double the amount in 1915.

The olive flourishes in all the Mediterranean provinces and is cultivated more or less exten-

sively throughout the peninsula as well as in the Balearic Islands. Large quantities are raised in the valley of the Guadalquivir and more than half the entire crop is from Andalusia. The cultivated area of olive trees in 1916 was 1,487,165 hectares, as compared with 1,481,962 hectares in 1915 and 1,431,027 hectares, the five years' average 1909 to 1913; or respectively 100.4 per cent and 102 per cent of the areas of those periods. The yield of olive oil was 2,071,150 quintals, as compared with 3,261,079 quintals in 1915 and 2,196,974, the five years' average 1909 to 1913; or respectively 63.5 per cent and 80.6 per cent of the yields of those periods. Shipments of olives and especially of olive oil increased in 1916, compared with the two previous years. In 1914, 44,811 metric tons of oil were exported; in 1915, 67,183; and in 1916, 88,852; an increase over 1915 of more than 21,000 metric tons.

A table of live stock on farms follows:

	1916	1915	Difference
Horses .....	488,715	512,453	23,738
Mules .....	912,984	950,836	37,852
Asses .....	838,648	826,204	12,444
Cattle .....	3,070,903	2,926,170	144,733
Sheep .....	16,012,277	15,994,608	17,669
Goats .....	8,207,360	8,216,882	9,522
Pigs .....	2,814,465	2,883,081	68,616
Camels .....	4,798	4,778	15

Spain's wool production may be estimated at 50,000 tons; the stock left from 1915 and the 1916 clip together aggregated about 80,000 tons. The exports of wool and woolen manufactures in 1916 amounted to 15,235 tons, compared with 19,457 tons in 1915.

The blast furnaces and smelting works were unusually busy, despite the coal situation. The production of coke increased from 597,315 tons in 1914 to 623,353 tons in 1915, the highest record in the past decade; briquettes decreased from 558,329 tons in 1914 to 555,357 in 1915; and cement advanced from 473,764 tons in 1914 to 476,255 in 1915. The output of semi-manufactured iron and steel increased from 382,044 tons in 1914 to 387,314 tons in 1915. The Spanish blast furnaces and rolling mills, employing 12,838 laborers, produced 772,093 tons of pig iron, iron and steel sheets, puddled iron, forged iron, and tempered steel, as compared with 464,000 tons in 1914.

**COMMERCE.** The total value of Spanish commerce during 1916 amounted to \$479,672,322—imports \$230,664,231, and exports \$249,008,091. The aggregate value of imports shows an increase of \$12,986,900 in 1916, compared with 1915, but aside from the receipts of gold and silver bullion and coin, the imports of merchandise actually decreased from \$174,657,688 in 1915 to \$164,424,496 in 1916, a loss of \$10,233,192. Live animals and manufactured articles brought in were greater in value than during 1915, but raw materials and alimentary products declined. During 1916 Spain had a favorable balance of trade of more than \$18,000,000, as compared with \$9,000,000 in 1915. The United Kingdom continued in 1915 to be the chief source of Spanish imports; in 1913 France was second, followed by Germany, the United States, and Argentina; in 1914 the United States was second, followed by France, Germany, and Russia; and in 1915 the United States was again second, followed by France, Argentina, and Portugal. As purchasers

of Spanish products France and Great Britain led. In 1913 Germany was third, followed by the United States and Argentina; in 1914 the United States was third, followed by Cuba and Italy; and in 1915 Italy was third, followed by Argentina and the United States.

The Spanish Customs Bureau has issued the following detailed table of Spanish exports for three years, values in pesetas:

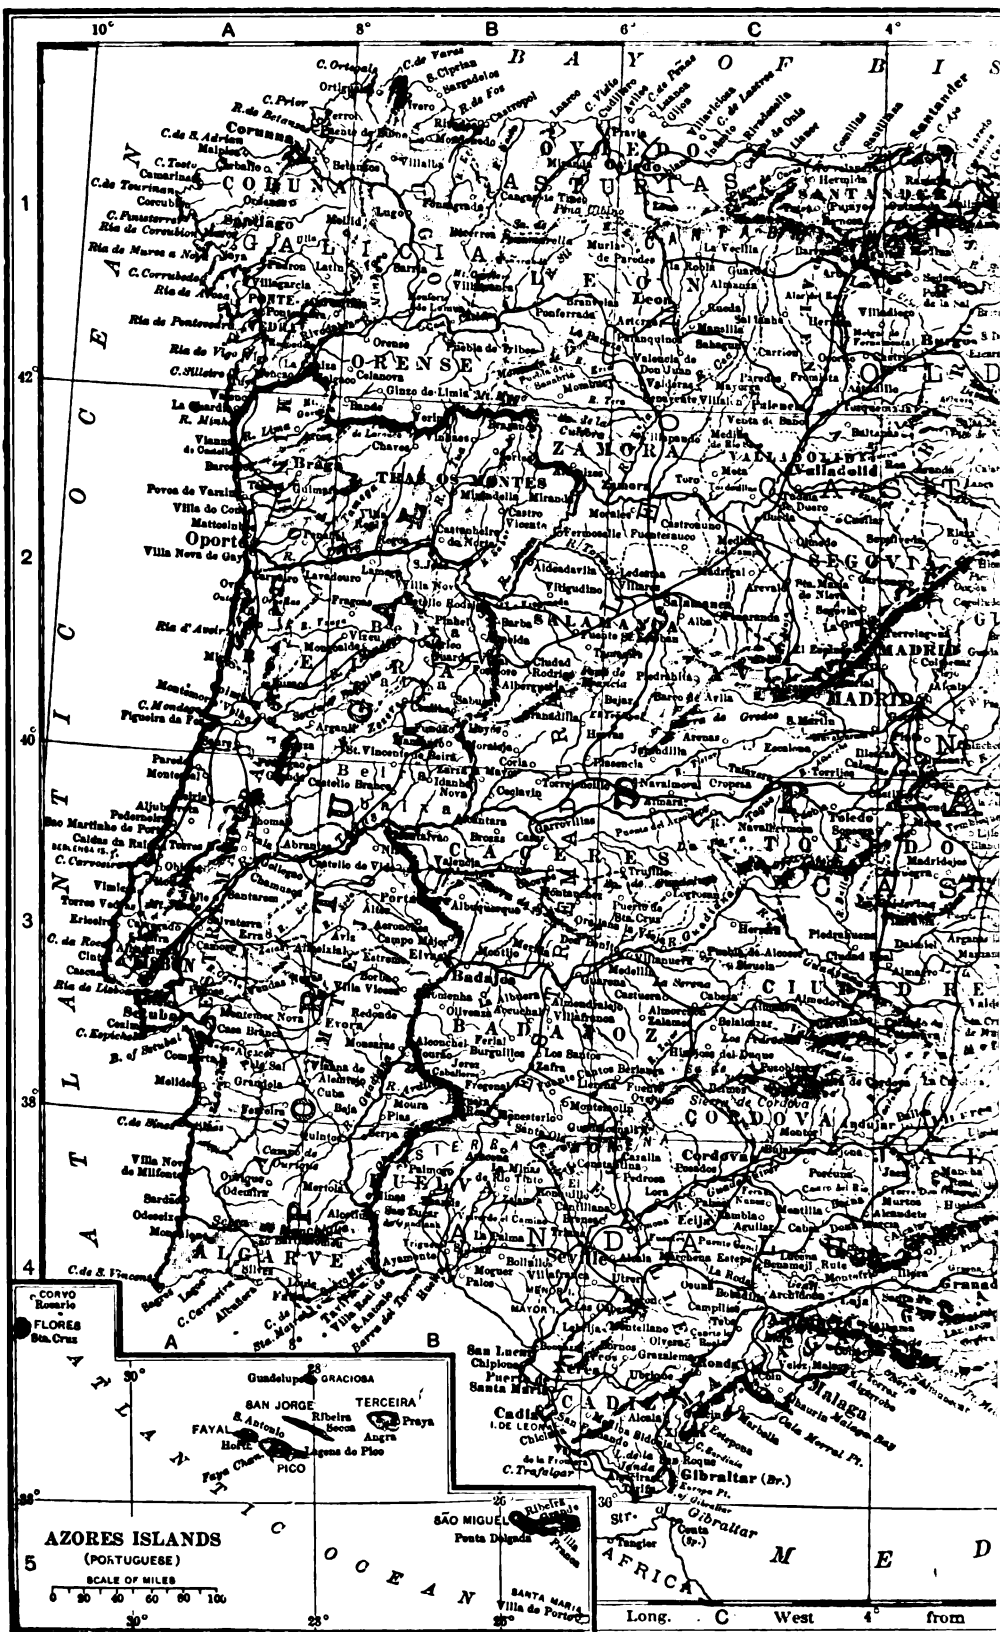

Exports	1914	1915	1916
Blende .....	2,767,000	578,000,000	2,986,000
Iron ore .....	67,046,000	49,601,000	56,629,000
Pyrite .....	33,199,000	29,421,000	35,665,000
Copper ore .....	1,818,000	605,000	859,000
Fire arms .....	4,218,000	3,961,000	25,099,000
Cotton goods .....	26,880,000	69,287,000	77,592,000
Shoes .....	8,226,000	33,544,000	13,962,000
Rice .....	6,971,000	21,863,000	2,534,000
Onions .....	14,820,000	14,784,000	14,800,000
Canned vegetables ..	9,250,000	14,492,000	14,653,000
Canned sardines ..	17,171,000	15,623,000	21,091,000

**SHIPPING.** The Spanish merchant marine included, in 1916, 843 vessels of over 50 tons register each, compared with 857 in 1915. Of these 240 were sailing vessels with a total tonnage of 31,101, an increase of 23 ships and nearly 2000 tons over 1915; 603 were steamers with a total tonnage of 816,747, a decrease of 37 ships and nearly 59,000 tons from 1915, the first decline in five years. The total tonnage of the vessels in the Spanish merchant marine of over 50 tons register was 847,848 in 1916, compared with 904,727 in 1915, a decrease of nearly 57,000, which represents the tonnage of the ships sold or sunk less the tonnage of new vessels constructed. The complete denationalization of the Spanish merchant marine threatening the country in 1915 through sales by Spanish ship-owners to foreign nations was checked early in 1916 by a royal decree, which prohibited the sale to foreigners of any steam or sailing Spanish merchant vessel of over 500 tons constructed within the last 15 years if of iron or steel, or within the last 10 years if of wood. Shipping suffered from the scarcity and high price of fuel, strikes, and other causes attributed to the war.

The shipbuilding yards on both sides of the peninsula were actively engaged during 1916 in the construction of new vessels and enlarging facilities. In 1917 the merchant ships on the ways, mostly of over 50 tons register, represented an estimated total displacement of 100,000 tons. The most important acquisition to the Spanish merchant marine was the steamer *Oceanic*, bought by the Compañia Transatlántica, rechristened the *Alfonso XIII*, and placed in the Spanish-American service. The government assumed authority to adopt whatever shipping measures it deemed advisable in order to supply the country with provisions; it might even seize vessels to restore them to the domestic service and to regulate rates, indemnifying the owners. Vessels entering Spanish ports in 1916, 13,013, of 10,937,699 tons; cleared, 16,165, of 14,067,730 tons.

**COMMUNICATIONS.** Spain began to build railroads in 1840, and at the beginning of 1916 there were 8700 miles of track. Up to 1915 the state had contributed \$139,000,000 for railway construction. In 1916 85.62 miles of track were built. An interesting development in Spain was a grant of a concession by the Spanish Ministerio de Fomento on January 12, 1917, to Don

Miguel Otamendi for an underground electric railway system in Madrid. This concession was to run for 90 years and a period of 8 years was to be allowed in the construction, which involved four double-track lines and a total length of 8.7 miles. The four great railway companies during the year 1917 joined in the formation of an important company to manufacture locomotives for themselves.

The present postal service in Spain is said to produce a revenue more than twice as great as its disbursements. There are 11 district inspectors, 49 principal administrators, 931 fixed general post offices, and 981 "ambulantes," served by one or more employees. In 1916, postal savings banks were established in Spain and their opening was welcomed as a national benefit. Although started when prices were abnormally high and generally unsettled conditions prevailed, these savings banks made a better showing at the close of the year than had been anticipated. Up to November 6 more than \$3,200,000 had been deposited. The largest number of transactions was in Madrid, followed by Seville, Cadiz, Malaga, and Murcia. This indicated that the postal savings banks were patronized more by the agricultural population than by the industrial workers; but in the large Spanish manufacturing centres working people's societies partially absorb local savings.

**FINANCE.** A feature during 1916 was the rise in value of the peseta, the standard unit of Spain, compared with the currency of other countries. The exchange value of the peseta rose from \$0.18 in 1914 to about \$0.20 in 1916. Since the beginning of the war Spain augmented its gold reserve by 114 per cent.

An extraordinary budget for the financial reconstruction of Spain over a period of ten years was submitted to the Cortes in the autumn of 1916. Laws were enacted providing for the administration of state-owned quicksilver mines, the manufacture and sale of explosives, and the production of matches.

A tentative budget for 1917 was voted as follows (amounts in thousands of pesetas):

<i>Revenue</i>		<i>Expenditure</i>	
Direct taxes on land, etc....	490,608	Civil list.....	9,050
Indirect taxes..	421,300	Cortes.....	2,821
Tobacco monopoly, lottery, mint, etc....	818,370	Public debt....	451,145
Revenue.....	22,187	Pensions.....	79,585
Sales.....	1,800	Pres. of Council	1,120
Public treasury	81,771	State.....	6,614
		Justice.....	19,774
		Worship.....	41,689
		War.....	169,294
		Marine.....	83,146
		Interior.....	93,108
		Instruction....	74,845
		Public works, etc.....	174,215
		Finance.....	18,627
		Tax collecting..	150,671
		Colonies.....	1,900
		Morocco.....	117,037
Total.....	1,281,036	Total.....	1,494,641

Actual revenue and expenditure for three years are shown below, in thousands of pesetas:

	1914	1915	1916
Revenue.....	1,408,638	1,916,528	1,280,536
Expenditure.....	1,527,448	1,948,958	1,465,044

The national debt of Spain on January 1, 1917, amounted to 9,365,072,616 pesetas, com-

posed as follows: 3 per cent and 4 per cent perpetual exterior debt—sealed bonds, 948,818,900 pesetas; 4 per cent perpetual internal debt, 6,638,899,619; 5 per cent redeemable debt, 1,526,195,000; 4 per cent redeemable debt (1908), 150,152,500; non-interest bearing debt due to officials, 1,006,597; "Pagarés" of the ministry for the colonies, 100,000,000. Announcement was made, March 11, 1917, by governmental decree, of the flotation of a new Spanish loan of 1,000,000,000 pesetas. The loan would be issued at 5 per cent and would be redeemable in fifty years. Subscriptions were opened on March 31. A Madrid dispatch of April 1 stated that the loan had been oversubscribed twenty-four times.

**GOVERNMENT.** The constitution vests the executive power in the king, acting through a responsible cabinet of ministers appointed by himself. The Cortes, conjointly with the king, exercises the legislative authority; the Cortes consists of a Senate (360 members, partly hereditary, partly appointive, and partly elective). Reigning sovereign, Alfonso XIII. Heir-apparent, Prince Alfonso, born May 10, 1907. The Cabinet, as constituted at the beginning of November, 1917, was as follows: Prime Minister and Minister for Foreign Affairs, Señor García Prieto (Marqués de Alhucemas); Justice, Fernández Prada; Finance, Ventosa; Interior, Bahamonde; War, La Cierva; Marine, Gimeno; Public Works, Alcalá Zamora; Public Instruction, Rodés. See *History* below.

#### HISTORY

**GERMAN PROPAGANDA.** The pro-German element was reported to be increasingly active early in the year. The view announced by Señor Maura, in the latter part of the preceding year, that the policy of strict neutrality was unwise and that eventually Spain should draw near to England and France stimulated the pro-German element to action. Their newspapers charged that a conspiracy was on foot to drive Spain into the war on the side of the Allies and that the prime minister, Romanones, was in league with that conspiracy. They declared that if he persisted in this design the army would revolt and the country be involved in civil war. A league for neutrality was formed under the nominal head of the Marqués de Polavieja which published alarmist articles in the newspapers. The pro-German element, which had hitherto controlled, for the most part, only clerical and reactionary newspapers, now was said to control seven of the daily newspapers in Madrid alone. These papers bent their energies to the defense of the alleged cruelties and transgressions of the Germans as fast as they were reported. The German element was further angered by the government's cordial reply to President Wilson's note and by the foreign minister's memorandum after the torpedoing of a Spanish vessel, denying the right of belligerents to destroy vessels carrying contraband of war. The pro-German parties now concentrated their efforts upon driving Count Romanones from office. The break of the United States with Germany caused much surprise in Spain, where it had been assumed that American neutrality was as certain as the neutrality of Spain itself. The German note announcing the renewal of submarine warfare occasioned much alarm and was regarded as the most serious issue that had

arisen since the war began. Nevertheless, there was no sign that strict neutrality would be departed from. The government's position was difficult. On the one hand the clerical, reactionary, and pro-German elements belittled the importance of the German submarine threat and justified it as a retort to the British blockade. The policy that they urged upon the government was to divert Spanish commerce from the Allied to neutral countries, thus avoiding all awkward consequences. On the other hand the Liberals and Radicals recommended vigorous action.

**FALL OF THE ROMANONES MINISTRY.** Early in January the attacks on the Ministry of Romanones as hostile to neutrality led to the resignation of the prime minister, but at the king's request he remained in power. On April 19, however, the political situation having become more acute, the Ministry resigned and a new Ministry was announced under Señor García Prieto, as prime minister.

The condition of the country on the fall of the Romanones Ministry was described by Spanish writers in the following terms:—Spain had ten organized political parties with the absolute monarchists on one extreme and the anarchists on the other. The Conservative group, comprising the church, the nobility, and the army, was said to be openly in sympathy with Germany. German agents had been very active in Spain and had circulated the report that if the Germans were victorious they would restore the Pope's temporal power. Another element, though having no sympathy with Germany, were hostile to France, never having forgiven her for the invasion of Spain in the time of Napoleon. The Liberals, Republicans, and moderate Socialists, sometimes all classed as reformists, were said to be entirely on the side of the Allies and some of them carried on a campaign in favor of the Allies. The most extreme element in this group went so far as to urge Spain's entry into the war against Germany and they did this long before the submarine campaign was resumed. In Spain the propaganda on behalf of the Allies was carried on to offset the German propaganda. There was much activity on both sides. The German methods were secret. They were accused of making tempting promises to Spain such as the return of Gibraltar and the acquisition of Morocco. Popular discontent showed itself especially in the threat of the workmen to go on a general strike as a protest against the inactivity of the government. The government's repressive measures checked this strike, but the unrest continued. When the Cabinet resigned the prime minister published a letter on April 20, saying that submitting to the submarine campaign of the Germans would endanger the life of the nation. The attitude of South America had a great effect upon the Spanish nation. By some it was regarded as a proof that Spain had lost completely her influence over Spanish America, and that this loss would soon be followed by an economic loss. They argued that Spain ought to have gone into the war on the side of the Allies and on the side of Latin America.

**THE PRIETO MINISTRY.** On April 21, two days after its formation, the new Ministry issued a note that it would observe strict neutrality. It sought to avoid so far as possible any difficulty with either of the belligerents. The

sinking of passenger vessels by the German submarines in Spanish waters had provoked protests from the Allies. These protests were received with courtesy and promises were made that the government would do its best to keep German submarines from finding their way into Spanish waters. Meanwhile notes were passing with great frequency between the Spanish and German governments on the subject of the submarine ravages. On April 20 a note was sent to the German government complaining that Spain's attempts to safeguard sea traffic against the methods of the German government had failed. It said the sinking of some vessels without warning such as the *San Fulgencio* had taken place; that the conditions imposed by the German government on the return of the vessels detained in English ports would have caused great loss; that the increased risks were rendering the economic existence of Spain still more difficult; it was evident that Germany did not intend to acknowledge Spanish rights or to take into account the consideration of a country which hitherto had been friendly; that if the Imperial government adhered to its present determination it must not be surprised if Spain in self-defense should use measures of protection. The replies of Germany to the Spanish complaints were in the main conciliating. On May 18 the Cabinet met to discuss the sinking of the steamer *Patricio*, and on the following day a note was addressed to Germany in regard to it. The German Ambassador immediately ordered the German consul to pay an indemnity to the chief engineer who had been killed on board the vessel, and on May 22 the prime minister announced that Germany had replied in a satisfactory manner to the Spanish complaint. On May 16, France, Great Britain, and Italy addressed diplomatic notes to the Spanish government complaining of the attacks by German submarines against Allied and neutral vessels in Spanish waters. While the government was trying to steer its way between the two contending parties there were demonstrations throughout the country on behalf of a policy more favorable to the Entente Allies. In April a meeting to that purpose was held at Madrid. It passed a resolution asking the government to break off diplomatic relations with Germany and to face the consequences, but the speeches at the meeting indicated that there was no desire to take part in the war itself. They aimed simply at a sympathetic neutrality toward the Entente Allies. The Socialist group at Madrid, which met about the same time in order to define the party's attitude toward the war, was equally disinclined to a participation in the conflict. It simply declared the necessity of breaking off relations with Germany and of defeating German imperialism. It concluded with the following statement: "The Spanish Socialist party thinks it equally indispensable that the working classes of all countries shall strive for the restoration of the international purged of the elements which in the present conflict shall prove to be unworthy of the attitude of our party. This restoration of the international must be carried out as quickly and as solidly as possible in order to obtain the complete defeat of the capitalist system by means of the socialization of production." In Catalonia and other northern provinces there was much diversity of opinion as to the attitude

that the country ought to assume. There was much discussion of the feeling in the army and several superior officers were removed because they were thought to be too warlike, and others because they were not thought to be warlike enough. After the Madrid meeting the government decided that no similar meetings either on behalf of the Allies or the Central Powers should be permitted. This provoked much discontent on the one hand, and on the other led the government to talk about a new suspension of constitutional guarantees in order to arrest the hostile movement which was developing everywhere. Toward the end of May it was apparent that the discontent in the army was increasing. Committees of officers and soldiers, especially in the infantry, were formed to present their claims and secure from the government reforms in the military administration. This demand took the form of an actual ultimatum. On June 9 the Prieto Ministry fell from power. By some this was attributed to a crisis resulting from the army's attitude; by others to the demand for a more vigorous policy toward German submarine aggression. A new Ministry was formed under Señor Dato.

**REVOLUTIONARY MOVEMENT IN THE ARMY.** Some of the grievances of the army seemed to be genuine. In the lower ranks the officers had suffered unfair treatment in the matter of pay and in the matter of promotion, and officers of all ranks complained, with apparent justice, of the government's neglect to provide the army with proper war material and equipment. In short, it seemed to be a passive military revolt. The new government under Señor Dato attempted to settle the main question by giving the infantry officers the right to form committees of defense. The revolutionary movement seemed for a time to be checked. There was sympathy with the officers at first, but alarm was felt at the precedent as endangering the constitution. There was some fear too that these committees of defense might not be confined to the simple purpose of improving the service, but might go further and secure for the army advantages which it ought not to have.

These defense committees notwithstanding the concessions made to them put forth further demands that became more and more radical. For example the infantry defense committees on August 9 passed resolutions demanding that certain generals should be considered enemies of the infantry and action should be taken against them. They named several generals that should be retired. The war minister, the Marquise de Estella, though sympathizing with the defense committees, refused to cancel the appointment as military governor of Valencia of one of the generals whose retirement they had demanded. As a result of this difficulty the war minister resigned. He declared that in mingling in politics the defense committees were committing the gravest error. The defense committees passed a resolution complaining that the principles of morality and justice and respect for law were entirely ignored, and that there was no hope for improvement because the two parties under the government showed no desire to improve. The political parties instead of profiting by the defense committees as a wholesome element making for reform treated them as enemies. This resolution then went on to say that in view of these dangers the infantry

defense committees regarded it as their duty to lay the matter before the king.

The army demanded reforms of a moral, economic, and military character. The most important one in the last named class was the suppression of favoritism in appointments. The army's programme did not involve any political reorganization, but it aroused the hopes of the radical elements everywhere. A large number of the officers concerned in the demand for reforms remained quiet after this first movement, thinking that further agitation might lead to a falling off in discipline, or, believing that their manifesto had accomplished or would accomplish their purpose. Some of them feared the social agitation that might result from further advance in this direction. On the other hand there were many who believed in direct interference in public affairs and according to the reports from Madrid in November it seemed that their opinion had some chance of success. After the general strike with its revolutionary tendencies had subsided, the army again assumed a critical attitude and with more assurance, because its first movement in the publication of the manifestoes had brought out the evidence that their desire for reform was shared by the rest of the country. As to the parliamentary programme, that is to say, the programme of the radical element in the Cortes, it comprised the following points: First, extensive decentralization and self-government for the different regions so far as it did not impair the political unity of the country; second, reform of the Senate, which should be recruited altogether by election, and the suppression of those senators who were chosen for life by the king or who held that office of right as *grandees* of Spain; third, modification of article seventeen of the Constitution in regard to the suspension of guarantees—such suspension henceforth not to exceed fifteen days and Parliament to be consulted on the question of a prorogation; fourth, the veto of an act of Parliament to be valid only during the session of the same legislature and any law to go into effect without the need of royal sanction if Parliament voted it a second time; finally, Parliament was to be in session each year as a matter of right from the first of October to the thirty-first of December. The radicals also demanded that a national body should be created to make sure of the fairness of the elections. In supporting this programme both the radicals in Parliament and the army for the most part gave the assurance that they had no wish to endanger the dynasty. As to the popular support of this course it seemed to be stronger than at any time previous because the people had become more conscious of their rights and were better prepared to support this middle class and military movement. While different means of carrying out the programme were advocated by the people, as well as by the army and the politicians, the end was in general the same.

**ATTITUDE TOWARD GERMANY.** By some, as noted above, the fall of the Prieto Ministry was taken as a sign that all parties were united in their patriotic indignation against the submarine policy of Germany. Dato hitherto had been a pronounced partisan of non-intervention and was regarded as the only man who, if he went to extremes against Germany would carry with him the non-

interventionists. Popular opinion had been much excited by the sinking of the *Patriota*, and the Spanish press expressed slight confidence in the effectiveness of protests from the Prieto government. When the preceding Ministry had sent a vigorous protest to Germany it had straightway been obliged to resign. Nevertheless, even pro-German Spanish papers now began to demand reparation for these outrages. Germany responded favorably to these demands, expressed her regrets, promised everything, and even offered to salute the Spanish flag as by way of public apology. But two days later a German submarine sunk another Spanish steamship, the *Telesfora*. The contrast between the German professions and their actual conduct caused bitter comment in the press. After the sinking of the *Telesfora* the Prieto Ministry was obliged to take the same attitude toward Germany as the former Ministry. Its subsequent resignation was taken in France as proof that Germany had Spain completely in her grip, and that she had perfected her means of directing public opinion in the same way that she had done in the United States and in Greece. German agents in Spain were said to be very numerous. Many German subjects had come to Spain after the loss of the African colonies and after Portugal's entry into the war. They joined with the German agitators already there and formed a large army for the systematic carrying out of the German aims. They sought to terrorize the timid and to appeal to the self-interest of others by declaring that the victory of Germany was certain and that it meant a victory for authority against democracy and revolution. Nevertheless, as the submarine outrages continued many believed that Spain's patience would be exhausted and that like the United States she would be forced into the war. The Dato Ministry was now the third that had to deal with this same problem and the issue before it was clear: It had either to accept a condition of things that had become unbearable or it had to take vigorous action and break off relations with Germany. At this time a union of parties was predicted and a rallying to the side of the Allies. The king himself had long favored the policy of intervention. After the sinking of the *Telesfora* the Spanish press, even including those papers which had hitherto been neutral, united in denouncing Germany's unjustifiable course.

**POPULAR DISCONTENT.** On June 18, a meeting of the four parties of the Left was reported. These groups comprised the Republicans, the Socialist Union, the Radicals, and the Reformists, and their meeting was for the purpose of bringing about an understanding among them. Afterwards the leaders of the respective groups signed a declaration saying that the present government gave no promise that the grievances from which the country suffered would be removed and that it would not be possible to re-establish the conditions of morality and justice that all classes demanded unless recourse was had to the sovereign will of the people, and unless that will controlled as a dominating force all the national institutions. It was reported that a movement for the complete reconstruction of the political fabric was in progress and was fast gaining adherents. Such a movement had its origin years ago in the discontent among the advanced parties with the existing methods and at the present moment both

the internal difficulties and the conditions brought about by the war had intensified this spirit of unrest. Even the former prime minister, Maura, head of the conservative party, admitted there were reasons for discontent. The new government announced that there was no intention of enforcing the censorship against criticism of the Ministry, but that the government would prohibit personal attacks on the part of irresponsible writers. He added that the country as a whole supported the neutral policy of the government. Meanwhile, according to the reports in the press, the Catalanian population was hostile to the government and was constantly clamoring for complete independence. In one of their newspapers it was openly declared that they would not submit to any law which was not voted by themselves and for themselves. The cost of living had increased during the last three months from 15 per cent to 25 per cent and the poor people could not stand the strain. Coal was so scarce that it was hardly possible to keep the trains running. On June 25 the Cabinet decided to suspend the constitutional guarantees. This was explained by the news from the provinces which indicated that the people were being incited to violence by the attacks in the press on the social system.

On August 13 it was announced that the government had decided to declare martial law throughout Spain. Disturbances were reported from various parts of the country, but they were said to have been virtually put down. A general strike, especially affecting Madrid, Saragossa, and Corunna was reported to have been called and a railway strike took place on the Northern Company's line. In Bilbao there was a conflict between workmen and the troops, but the casualties were slight. Later the strikers were said to have attacked the police. At Madrid there were disorders on the morning of August 14, but they were put down by the troops.

The government's unfavorable response to the demand of the Catalanian representatives that the Chambers should be called together as a constituent assembly was published on July 9. Three days later the Catalanian deputies protested against this response. On July 14 the president of the council declared that since the rights of meeting were suspended the government could not authorize the meeting of representatives at Valencia. Nevertheless, the latter did meet on July 18, but at the opening of the session the governor of the city appeared and ordered its dissolution. The members dispersed without causing any disorder. Agitation and strikes were reported at Valencia on June 21, but order was restored in a few days.

Discontent among the middle classes and the intellectuals dates back to the period following the war with the United States when Spain suffered the loss of her colonies. Angered at this blow to their pride and their interests certain classes whose principal champion was Costa started a movement for internal reform. A programme for changes of a political, economic, and administrative character was put forward with the support of the middle classes. These attempts failed and the situation went from bad to worse. On several occasions since the country was shaken by popular agitation which indicated a serious condition of discontent. The war aggravated this condition. While public

opinion was greatly divided during the war on external questions, it was much less so in regard to the internal situation. The more thoughtful people in Spain believed that it was necessary to put into execution a plan of reform which would bring the security and calm that was necessary for the prosperity of the country. The officers of the army and the minority element in Parliament constituted themselves the mouth-piece of this point of view. One outcome of it was the publication by the military committees in the beginning of July, 1917, of the manifesto previously referred to. This manifesto, together with the decision of the government not to open Parliament, were the immediate causes of the popular unrest.

**FALL OF THE DATO CABINET.** The grievances against the Cabinet were numerous and complex, but in general they had to do with the handling of the general strike, the maintenance of the censorship, and the failure to call Parliament. In short, the fall of the Cabinet was due to the same discontent throughout the country that had led to the defense committees' movement in June, the Barcelona assembly in July, and the general strike in August. Much alarm was felt, and in political circles there was even talk of the military government. Specifically the fall of the Cabinet was attributed to the efforts of the military defense committees working through the political parties in Parliament.

**SECOND PRIETO MINISTRY.** The ministry of Dato failed to deal efficiently with the various difficulties and fell from power at the end of October. A Ministry of concentration was then attempted from among the conservatives, but did not succeed. Thereupon Señor García Prieto, chief of the Democratic group, which was the largest parliamentary party, formed a Ministry (November 3) which promised better. It still partook of the character of a compromise ministry. The prime minister had failed to unite as he hoped to do all the parliamentary groups. Thus the Ministry contained an ultra-Conservative colleague of Maura, but no representative of the group that Dato had directed, and while there was a Republican in it, namely, Señor Rodés, the reformist group, led by Álvarez, had no representative. Thus it seemed to be formed exclusively on an opportunist basis and critics doubted whether it could bring anything better than a temporary solution. In that case there was danger that the military problem would become more grave, for the government would become more and more need the support of the army if the internal difficulties increased. Thus the army would become more and more the controlling factor in the situation. Hence the office of minister of war was especially important. This portfolio was bestowed upon Señor Juan de La Cierva, well known as the minister of the interior, who had taken stern measures in suppressing the Barcelona riots in July and August, 1909. He and the Maura Cabinet had fallen from power as a result of the criticism following that event and he had since then never occupied a position in the government. Señor García Prieto had been one of his bitter opponents at that time, but it was expected that in the existing crisis these enmities and difficulties would be forgotten.

**SPANISH LITERATURE.** At the moment of going to press, official statistics for Spanish

literature in 1917 had not yet appeared, but from the figures available, it seemed probable that the total output for 1917 would surpass by about one hundred volumes the production of 1916, although it would still fall some two hundred volumes short of the record for 1915. The official figures of the *Bibliografía Española* for December 1, 1917, were 1362. The great war continued to hamper the importation of books and this fact for a third time controls the scope of this résumé.

**CERVANTES TERCENTENARY.** The tercentenary of Cervantes's death, which occurred in 1616, caused the production of numerous studies concerning the author and his works. Of those that have appeared since our last article was written, the following should be mentioned: J. Givanel Más, *Catálogo de la colección cervantina firmat per D. Isidro Bonsoms y Siscart, y cedida per ell a la Biblioteca de Catalunya*, vol. i (Any 1590-1800) and *La obra literaria de Cervantes* (his reception discourse for the Real Academia de Buenas Letras de Barcelona); L. Miner, *El Cura según Cervantes*; L. Pérez-Rubín, *La literatura del Quijote*; D. de la Asunción, *Cervantes y la orden trinitaria*; J. López Barrera, *Cervantes y su época*; Cervantes, *Don Quijote* (vols. v and vi, completing the critical edition by F. Rodríguez Marín); Cervantes, *La ilustre fregona* (F. Rodríguez Marín); P. Savj-López, *Cervantes* (Spanish translation by A. G. Solalinde); J. M. Chacón y Calvo, *Cervantes y el Romancero*; Cervantes, *Poesías (Compiladas y prologadas por Ricardo Rojas)*; J. Fitzmaurice-Kelly, *Cervantes* (originally published in English, 1913; new and revised edition in Spanish by B. Sanín Cano); F. A. de Icaza, *Supercherías y errores cervantinos puestos en claro*; Cervantes, *Novelas ejemplares* (illustrated edition with prologue by Blanca de los Ríos, under the auspices of the Real Academia Hispano-Americana de Ciencias y Artes de Cadiz); and Cervantes, *Obras Completas: Comedias y Entremeses*, vol. ii (R. Seheville and A. Bonilla y San Martín).

**CENTENARIES.** The year saw the celebration of the centenary of the birth of two great poets: José Zorrilla (author of so many beautiful Spanish legends and reviver of the Don Juan legend in Spain) and Ramón de Campoamor (creator of the exquisite *Doloras*).

**NECROLOGY.** Spanish letters and Spanish scholarship suffered severely in the death of Francisco Fernández y González (member of the Royal Spanish Academy, Rector of the University of Madrid and a brilliant, prolific writer on questions of ethics); and Joaquín Dicenta (brilliant journalist, poet, novelist, and dramatist, author of the ecclesiastically prohibited *Juan José*, in which he himself frequently played the title rôle). Although Pedro B. Palacios (known best by his pseudonym "Alma Fuerte") and José Enrique Rodó were not Spaniards, their deaths may be said in a very real sense to have impoverished Spanish letters. One of the glories of Argentina, Alma Fuerte was called "the poet who is all heart, the master enamored of children and flowers, who with his *Proféticas* and *Evangelicas* brought peace to afflicted souls and to the humble destitute in this vale of tears." And yet, even in his old age and despite such a past (or perhaps because of it), this world-war so stirred his soul with indignation that he wrote a poem that is considered the most scathing arraignment of the

Kaiser that has ever been written. The Uruguayan Rodó was as highly esteemed in Spain and Argentina as he was in his own land, where his brilliant novels and essays had earned him a position of unchallenged leadership.

LITERARY CRITICISM flourished, as witness the following titles, in addition to those cited in connection with Cervantes: H. Medinaveitia, *Béquer*; R. Monner Sans, *Don José Selgas*; N. Alonso Cortés, *Zorrilla, su vida y sus obras* (vol. i); J. Cejador y Frauca, *Historia de la lengua y literatura castellana* (vols. v, vi, and vii, from Philip IV through 1849); F. de Rojas, *Zorrilla, "Cada cual lo que le toca" y "La viña de Nabot"* (Américo Castro); E. Juliá Martínez, *El americanismo en el idioma castellano*; C. Eguía Ruiz, *Literatura y literatos: estudios contemporáneos (Segunda Serie)*; A. López, *Estudios crítico—históricos de Galicia*; E. Cotarelo y Mori, *Actores famosos del siglo XVII, Sebastián de Prado y su mujer Bernarda Ramírez*; N. Alonso Cortés, *Viejo y nuevo; Relaciones históricas de América, Primera mitad del siglo XVI (Sociedad de Bibliófilos Españoles)*; *Dos romances anónimos del siglo XVI* (H. Thomas); and Julián de Armendariz, *Las Burlas veras* (S. L. M. Rosenberg). In *Clásicos Castellanos* the following volumes appeared: 32, Moreto, *Teatro* (N. Alonso Cortés); 33, Luis de León, *De los nombres de Cristo*, II (F. de Onís); 34, Quevedo, III: *Los sueños*, II (J. Cejador y Frauca); 35, Francisco de Rojas, *Teatro* (F. Ruiz Morcuende); 36, Cervantes, X: *Novelas ejemplares*, II (F. Rodríguez Marín). The *Biblioteca Calleja* is publishing a series of neat, attractive volumes, small in size and low in price (similar to the Everyman's Edition). M. Menéndez y Pelayo's *Obras* reached vol. vii, and Juan Valera's *Obras Completas* vol. xlv.

POETRY, instead of giving us a lot of new material, seemed to pause and collect into permanent form the product of the past twenty years. Of the *Obras Completas* of Juan Ramón Jiménez three volumes appeared, in addition to a volume of prose (*Platero y yo*) and a volume of *Poetas Escogidos*. Antonio Machado likewise published his *Poetas Completas* and *Páginas Escogidas*; and Francisco Villalpando put forth *Andaluza, Judith, La Maja de Goya, and Pas*, all constituting his best works. To F. Pérez Menéndez Maturana we owe the *Ruta de Ensueño*, which some critics place above his other works. The most notable poetic event of the year was the publication by R. Menéndez Pidal of a recently discovered fragment of a thirteenth century epic poem entitled *Roncesvalles*.

DRAMA did not show very great activity. Additional volumes of the complete works of several prominent writers appeared: e.g., Jacinto Benavente, and M. Linares Rivas. Also a few writers produced new plays: J. Grau, *El Conde Alarcos*; J. M. Acevedo, *Ley de honor*; and the Alvarez Quintero brothers kept up their usual standard of fecundity. Ángel Guimerá, the veteran Catalan dramatist, won a triumph with his peace-play *Jesús que vuelve*.

NOVELS, ESSAYS, MEMOIRS. For the novel, the *Biblioteca Calleja* gave reproductions of works of authors recently dead or still living: e.g., Clarín, Palacio Valdés, and Azorín. Jaime Solá won praise with his *Anduriña*.—Miguel de Unamuno, ex-Rector of the venerable University of Salamanca, published four volumes of his brilliant *Ensayos*; and José Ortega y Gasset pub-

lished the second volume of his work called *El Espectador*.—For some time before his death José Echegaray had been working upon his memoirs. The first volume (*Recuerdos*) has appeared.

Several interesting books on the war should be noted: R. del Valle-Inclán, *La media noche: Visión estelar de un momento de guerra*; R. Pérez de Ayala, *Herman encadenado: Notas de un viaje a los frentes del Isonzo, la Carnia, y el Trentino*; A. Inada, *Páginas de la guerra*; E. Pardo Bazán, *Porvenir de la literatura después de la guerra*; Jacinto Benavente, *El año germanófilo* (Benavente is himself violently pro-German); Azorín, *Entre España y Francia (Páginas de un francésfilo)*.

The Spanish Royal Academy's activities were chiefly as follows: Fac-simile reproduction of the *Obras de Cervantes*: vol. i, *La Galatea*, vol. ii, part 1 of *Don Quixote*; Lope de Vega, *Obras*, vol. iii (new edition by Cotarelo); a newly revised edition of its Spanish Grammar. In addition the Academy awarded the usual prizes: the "Fastenrath," to Enrique de Mesa, *El Silencio de la Cartuja*; the "María del Pilar Roversa," to R. Pamplona y Escudero, *El cura de misa y olla*; the "Piquer," to José Rincón Lazcano and Eduardo Montesinos, *La Alcaldesa de Hontanar*; and the "Chirel," to Francisco A. de Icaza, Mexican Ambassador to Spain, for his articles of literary criticism.

SPENCE, FRANCIS STEPHENS. A Canadian municipal expert and temperance advocate, died in Toronto, Ontario, March 8, 1917. He was born in 1850 in Donegal, Ireland, but early came to Toronto, with the public affairs of which city he was identified for many years. Up to 1882 he was a headmaster of schools. Between 1892 and 1915 he served frequently as alderman and as city controller, gaining wide recognition as an authority on municipal government and especially finance. Mr. Spence was largely responsible for important public undertakings, notably the Ontario Hydroelectric system and the \$19,000,000 Toronto harbor improvement. Throughout Canada he was known as a leading advocate of temperance, a cause to which he devoted his oratorical and editorial abilities. He served as managing editor of the *Pioneer*, an organ of the temperance movement, and had been editor of several similar journals.

SPIRITUALISTS' ASSOCIATION, NATIONAL. This association, which was incorporated in 1893 to combine for more effective working purposes the local Spiritualist societies of the United States, had, in 1917, over 1000 local working societies. There were 22 State associations, over 500 other local societies, and 32 camp meeting associations. More than 200 churches and temples, together with camp meeting property, were valued at about \$6,500,000. The number of ordained ministers was 500, of public mediums 1500, and of adherents over 600,000. The annual convention, which was held in New York City, was the most successful thus far in numbers of delegates and good results achieved. The association, according to an official statement, is making good progress, increasing its local bodies, growing in member-

ship and becoming stronger financially. It is building many local churches and conducting a vigorous propaganda. The itinerant system is rapidly passing away, and ministers are being settled over local societies and churches by the year. The officers of the association are: President, George D. Warne; secretary, George W. Kates; treasurer, Cassius L. Stevens.

**SPIROCHETE BRONCHITIS.** This affection has been encountered in Ceylon, India, the Philippines, Europe, and elsewhere, and was discovered by Castellani. It is sometimes known as Castellani's Bronchitis. It is due to a spirochete, which may be observed under the microscope, in the sputum. Spirochete bronchitis is chiefly interesting because it is nearly always mistaken for tuberculosis. There is an acute and a chronic form, the former running its course in five or six days and being accompanied with high fever and profuse expectoration of a whitish or yellowish sputum. The chronic form is characterized by a hectic fever, resembling that of tuberculosis, with cough, expectoration, and sometimes bleeding from the lungs. Arsenic seems to be the most reliable remedy and salvarsan is recommended on account of its well-known antagonistic effects upon spirochetes.

**SPORTS.** War brought about unusual conditions in every realm of sport during 1917. The winning of championships and the establishment of new records which in former years had served to measure the success or failure of athletic endeavor afforded no satisfactory standard in the period just passed. Championship events in the various sports were for the most part abandoned, while the presence of star athletes in the army and navy caused a big drop in the number of record breaking performances.

If the achievements of the year in the way of a wider participation in sports than ever before and in the aid rendered the government by the athletes individually and by athletic enterprises in general be considered, 1917 could be regarded as the banner year in the history of sport in the United States.

The effect of the war on the several branches of athletics and the valuable contributions made by athletics and athletes to the country's need in the crisis are covered in the various YEAR BOOK articles on **ATHLETICS, TRACK AND FIELD; BASEBALL; GOLF; TENNIS;** etc.

**STARS.** See **ASTRONOMY.**

**STATE BANKS.** According to the report of the comptroller of the currency there were in the United States on June 20, 1917, a total of 20,319 State banks. These included the regular commercial State banks, savings banks (q.v.), loans and trust companies, and private banks. Their total resources were \$20,836,000,000, an increase of \$2,500,000,000 over 1916. Loans and discounts aggregated \$11,674,000,000, an increase for the year of \$1,510,000,000; their investments in bonds and securities totaled \$4,991,000,000. Their liabilities included capital of \$1,191,000,000; surplus of \$1,183,000,000; and individual deposits of \$16,766,000,000.

The regular commercial State banks numbered 15,988, an increase over 1916 of 518; included here were stock savings banks of Virginia, South Carolina, Tennessee, Michigan, Wisconsin, North Dakota, Kansas, Montana, Idaho, and Nevada, as well as the loan and trust companies of eight

States. These nearly 16,000 banks had aggregate resources of \$6,799,669,000. Their loans and discounts were \$4,111,500,000; individual deposits, \$5,390,800,000; capital stock paid in, \$600,064,000; and surplus and undivided profits, \$305,130,000. There were 1274 of these banks qualified to receive deposits of the Federal Postal Savings System on June 30, 1917.

Loan and trust companies, not included above, numbered 1608 on June 20. Their aggregate resources were \$7,899,800,000, including loans and discounts of \$4,311,700,000, and investments in securities of \$1,789,765,000. Their capital was \$505,507,000; surplus, \$534,778,000; undivided profits, \$107,006,000; and individual deposits of \$5,797,000,000. While the growth of loan and trust companies in 1917 was substantial it was less phenomenal than in some recent years. A considerable number of the larger companies entered the Federal Reserve System during the year (see **BANKS AND BANKING**). There were 568 trust companies qualified as postal savings depositories in June, 1917.

There were 936 private banks had total resources of \$197,937,000. Their total deposits were \$161,924,000. Only 13 of them were qualified to receive postal savings funds and these were all in Indiana.

**STATISTICAL ASSOCIATION, AMERICAN.** The seventy-ninth annual meeting of this organization was held at Philadelphia, December 27-29. In conjunction therewith were numerous other organizations as described under *American Economic Association* in the article **POLITICAL ECONOMY**. Among the addresses were the following: "The Mortality Rate in Childhood," by Louis I. Dublin of the Metropolitan Life Insurance Company; "Methods of Analyzing Occupational Vitality," by Arme Fisher of the Prudential Insurance Company; "Some Preliminary Results of Industrial Fatigue," by Professor Robert E. Chaddock of Columbia University; "Infantile Mortality Statistics of the Children's Bureau," by Dr. R. M. Woodbury of the Children's Bureau. In a joint session with the American Association for Labor Legislation, presidential addresses were given by Professor Irving Fisher, on "Health and War," and by Professor Allyn A. Young on "Statistics in War and Peace." In a session devoted to "The Organization of War Statistical Work in Washington," addresses were given by Walter M. Adriance of the Bureau of Research of the War Trade Board, and by Leonard P. Ayres of the Division of Statistics of the Council of National Defense. The following addresses related to "The Vital Statistics of the War": "Army Anthropometric Statistics," by F. L. Hoffman of the Prudential Insurance Company; "Plans for the Vital Statistics of the War," by John S. Fulton of Washington, D. C., and "The Development of Medical Sanitary Statistics," by Walter F. Willcox of Cornell University. There was an address by Horace Sechrist of Northwestern University of "Statistical Units as Standards"; and a round table discussion of "Internal and External Statistical Needs of American Business." The association issues *Quarterly Publications of the American Statistical Association*.

**STEAM ENGINES.** As distinct from the steam turbine (see **STEAM TURBINES**) the reciprocating engine was being constructed with prac-

tically no change of form during the year, and few if any radical developments. There was considerable demand for marine engines in connection with shipbuilding (q.v.). A notable engine built and put into service during the year was a rolling-mill reversing engine with cylinders 36 in. and 70 in. with a 60-in. stroke. This engine when running at maximum speed was capable of developing more than 30,000 horsepower if the maximum torque occurred at the same time, but under conditions of service it was doubtful whether it would be called upon for more than 11,000 horsepower. The engine was geared and its approximate weight was 1,350,000 pounds.

**STEAM TURBINES.** The notable list of steam turbines ordered or designed in 1916 (see YEAR BOOK for 1916) was increased in 1917 by a 45,000 kilowatt two-cylinder, compound unit, and a 70,000 kilowatt, three-cylinder machine, the largest ever made, for the Duquesne Light Company of Pittsburgh. With the completion and testing of these various large units, it would be possible to decide definitely as to their efficiencies and economy, for the mammoth unit was not being accepted by the engineers as a demonstrated success, and it was claimed that certain further developments were essential. Improvements in designs for high pressure and intermediate heating of the steam to raise the average temperature were two of the suggested improvements. There was considerable diversity in the activities of the various makers of steam turbines. By some the impulse turbine with a single-cylinder machine was being advocated, even in the larger sizes. On the other hand the reaction turbine with two or even three cylinders was being favored and such machines were being made. In the impulse turbines, symmetrical cone-shaped construction was the general aim of the designers, with the elimination of angles and the securing of straight paths for the steam. The earlier stages were becoming smaller in diameter and fewer to minimize the friction and leakage, and better material was being used for the blades. A single throttle valve was replacing the numerous control valves regulating the quantity of steam.

Smaller turbines were manufactured in large numbers and were said to be replacing the reciprocal engine even in the small office building plants, especially in the western part of the United States. The advantages claimed were small space and little attendance required. The use of a reduction gearing to permit economical speeds in different classes of work was a further advantage and the fact that there was no oil in the exhaust steam also promoted economy and speed. Improvements were made in the small turbines used for various engine-room auxiliaries and the advantages were clearly demonstrated. The turbine was proposed for locomotive drive on the score that with high speed and limited space more power could be concentrated. No definite experiments, however, to demonstrate its application in this field were recorded.

## STEVENS INSTITUTE OF TECHNOLOGY.

A non-sectarian institution for the technical education of men, located at Hoboken, N. J. In the fall of 1917 there were 520 students and 41 members of the faculty. Louis Alan Hazeltine was appointed acting professor of electrical engineering to succeed Professor Albert F. Ganz, deceased. Volumes in the library numbered about 12,000. Productive funds in 1917 amounted to \$1,550,000, and the income therefrom to \$68,566. Compulsory attendance at military drill is required of all classes. The institute was founded in 1870. President, Alexander C. Humphreys, LL.D.

**STILL, ANDREW TAYLOR.** Founder of the osteopathic school of medicine. He was born on August 6, 1828, and died on December 12, 1917. He served as a surgeon and major of the Twenty-first Kansas Volunteers during the Civil War. In 1874 he began to practice osteopathy. He was openly and bitterly opposed by his former friends in medical science but with the aid of his sons established on a firm foundation the new method of healing. In 1892 he founded the American School of Osteopathy at Kirksville, Mo. He was the president of this institution. His writings include: *Autobiography of A. T. Still*; *Philosophy and Mechanical Principles of Osteopathy*; *Osteopathy, Practice, and Research*.

**STIMSON, LEWIS ATTERBURY.** A noted surgeon and professor of surgery in Cornell Medical College. He was born in 1844 and died on September 17, 1917. He was graduated from Yale University in 1863, and later from the Bellevue Medical College in New York City. During the Civil War he served on the staff of General Terry. Since the outbreak of the European War, Dr. Stimson had made two visits to the battlefield in the interests of relief. He was interested especially in the care of French orphans and was a member of several French societies devoted to this work. He wrote: *A Treatise on Dislocations*; *A Treatise on Fractures*; *Operative Surgery*; and had translated Lacombe's *History of France*. He was a member of the American Surgical Society and the New York Medical Society.

**STOCKHOLM PEACE CONFERENCE.** See SOCIALISM.

**STOCK RAISING AND MEAT PRODUCTION.** The importance of live stock production became recognized during the year 1917 as second only to wheat production. This was particularly true of meat food products and wool. An evident tendency towards a shortage in the world's supply of live stock before the outbreak of the great war was accentuated as the conflict progressed. The slaughter of animals in Europe had been very great. An estimate was published by the United States government, based on confidential reports, to the effect that by 1917 the herds of Europe had been diminished by 28,000,000 cattle, 54,000,000 sheep, and 32,000,000 hogs. Of these animals about 33,000,000 all told were found in the allied countries. The decrease in breeding stocks among the Central Powers could not be accurately determined, but fairly reliable information indicated that the slaughter of meat animals in those countries was continuing and that the situation was very acute at the end of 1917.

In the southern hemisphere stocks of beef

cattle appeared to be keeping up, but supplies of sheep were reported as considerably less in Australia in 1915 than in the previous year. The decrease of all sheep in the world was estimated by the National Association of Wool Manufacturers of the United States at 18,000,000, of which the unfavorable season in Australia in 1915 accounted for 12,000,000 head. Cattle supplies in the United States were apparently larger than at any time during the past ten years. Supplies of hogs, on the other hand, were less than they were the preceding year, although probably larger than they were five years ago. The supplies of sheep still showed a slight tendency to decrease in the United States.

**MEAT SUPPLIES.** The Allied Powers were depending largely on the United States for supplies of meat for civilian and military consumption. This resulted, as stated in the 1916 YEAR BOOK, in a great increase in meat exports from the United States. The demand was met by a certain amount of increased production in the United States and by economy in domestic consumption. For the fiscal year ended June 30, 1917, there was a slight decrease in the total meat exports from the United States, as compared with the previous fiscal year, the total being 2,400,907,776 pounds of meat and meat products in 1917, as compared with 2,500,566,309 pounds in 1916. The decrease was mainly in beef and beef products.

Pork exports for the three fiscal years of the war and the fiscal year preceding were as follows:

1917 .....	1,501,960,961 pounds
1916 .....	1,462,696,961 "
1915 .....	1,107,160,680 "
1914 .....	922,747,021 "

The average amount of total exports of pork products for the fiscal years 1911, 1912, and 1913, was 979,907,181 pounds. Naturally the greatest amount of the increase in pork exports during the war was found in the exports of bacon, which increased from 193,964,252 pounds in the fiscal year 1914 to 667,156,061 pounds in the fiscal year 1917.

The trend of the trade in meat animals in the United States is clearly indicated in the reports of the Federal Meat Inspection Service, which appear in the accompanying table for the fiscal years 1907 to 1917, inclusive.

**WOOL SUPPLIES.** The problem of the wool supplies for domestic use and the Allied armies received attention from the British Government from early in the war and there were many rumors of possible official steps by the United States being taken to safeguard supplies. The British Government was buying the home wool clip and that in South Africa and Australasia, on the basis of 30 per cent above pre-war prices. Agents of the British Government classify the clip. Some objection was made to this method of handling the matter in South Africa, but there was no criticism from Australia and New Zealand so far as could be learned.

No steps of this nature up to the end of 1917 were taken for handling the American or Argentine clip. The regulations of the United States government, however, gave the government an option on imported wool at 5 per cent below prices prevailing on July 30, 1917. Wool production in 1916 was computed by the National Association of Wool Manufacturers at 2,717,233,100 pounds, as compared with 2,836,519,134 pounds in 1915, showing a decrease of over 119,000,000 pounds. No accurate estimates for production in Central Europe, Russia, and Turkey were available, but it was thought that the production in those countries was less than had been conceded.

**LIVE STOCK PRODUCTION CAMPAIGN.** A conference of representative live stock men was called at Washington by the secretary of agriculture and the food administrator on September 5-7, at which the secretary of agriculture presented problems of production which must be met in order for the United States to do its share in furnishing animal food products and wool supplies, and the food administrator discussed the problems confronting him in connection with the purchase of meat on account of the United States and Allied governments, the Red Cross, Belgian relief, etc.

The topic of liveliest interest was the question of price adjustments of live stock products, and it was emphasized as essential to stabilize prices in such a way that the consumer would be protected and the producer would receive a remunerative figure for his animals. To that end a committee representing the pork producers subsequently worked out a system, the main purposes of which, as announced by the food administration, were to see that the producer at

NUMBER OF ESTABLISHMENTS AND TOTAL NUMBER OF ANIMALS INSPECTED AT  
SLAUGHTER UNDER FEDERAL INSPECTION ANNUALLY, 1907-1917.

Fiscal Year	Estab- lishments	Cattle	Calves	Pigs	Sheep	Goats	All Animals

1916 .....	875	7,404,288	2,048,022	40,482,799	11,985,926	180,356	62,101,391
1917 .....	883	9,290,489	2,679,745	40,210,847	11,343,418	174,649	63,708,148

Due allowance must be made for the fact that the average weight of the animals slaughtered in 1917 was less than in the previous year. On account of the scarcity of grain, cattle and hogs had not been finished to as heavy weights as in years when there was an abundance of corn.

all times could count on a fair price for his hogs that would be profitable to him, to encourage farmers to increase the number of hogs bred, to limit the profit of the packer and the middleman, and to eliminate speculation. The plan of the food administration contemplated the licensing of packers, which was put into effect No-

vember 1, and the exercise of rigid control. It was announced in the press that profits in the meat business must in no case exceed 2.5 per cent of the sales, and that the annual earnings of packers could not exceed 9 per cent of the average capital necessarily used in the business.

The minimum price to be attempted to maintain for hogs was about \$15.50 per hundred-weight for the average of the packers' droves on the Chicago market during the fall and winter months, and a ratio of pork to corn prices of about 13 to 1 was suggested; that is, as to the hogs farrowed in the spring of 1918 the attempt will be to stabilize the price so that the farmer can count on getting for each 100 pounds of hog ready for market, 13 times the average cost per bushel of the corn fed into the hogs. This is not a guaranty, but represents the intention and policy of the Food Administration. No announcement was made of similar arrangements concerning price regulation of beef cattle.

In order to insure sufficient pork supplies for the United States and its Allies, the government determined upon an increase of 15 per cent in production in the United States as necessary in 1918. This meant that approximately 10,000,000 more hogs must be produced in 1918 than in 1917. The amount was prorated to the different States according to the 1917 corn yield, the increase allotted varying from 5 per cent in Georgia and West Virginia to 25 per cent in Kansas and Iowa, 30 per cent in Alabama, and 50 per cent in Missouri. An active campaign was being projected in the different States, and gratifying reports were being received as to its success.

The supply of brood sows was unusually short, the shortage being estimated as high as 20 to 30 per cent in various corn belt States. The shortage was brought about by the scarcity of corn of the 1916 crop and the extremely high prices paid for hogs during the first nine months of 1917. To overcome this shortage, the Department of Agriculture was urging the breeding of sows for late litters as well as for early litters.

**THE BEEF CATTLE INDUSTRY.** Probably the most noteworthy event in beef cattle affairs during the year was the release from quarantine against Texas fever of more than 70,000 square miles in the South. See **VETERINARY SCIENCE**.

The beef cattle industry on the range suffered during the year from one of the most serious droughts in the history of the country. This was particularly acute in the southwestern part of Texas, where in some sections rain had not fallen for fifteen months or more. In some parts of the State three-fourths of the cattle were shipped out, thus saving the best of the breeding herds. The Department of Agriculture assisted in this, securing the movement of approximately 150,000 head of breeding cattle, mostly cows and heifers, into Louisiana, Arkansas, and States further east, shipments going as far as Florida and Georgia.

The drought prevailed to a greater or less extent over the entire Great Plains region, resulting in considerable sacrifice of cattle. By means of the agricultural extension service and other agencies interested, efforts were made to safeguard the Western herds.

The Southern country offers the best op-

portunity for the expansion of the beef cattle industry which yet remains undeveloped in the United States. Not only can the farms of the South carry greatly increased numbers of meat animals, but the cut-over timber lands of that section offer a field for very largely increased production. The area of these lands was estimated at 78,000,000 acres, to which the cutting of timber was adding about 10,000,000 acres annually. Eventually the cut-over timber lands of the South would include an area of approximately 300,000,000 acres.

To consider this subject, two conferences were held at New Orleans during the year under the auspices of the Southern Pine Association, as a result of which the Southern Cut-Over Land Association was established as a bureau of the Southern Pine Association, to develop the cattle and sheep grazing herds on the cut-over lands, to encourage the practice of tick eradication, and to study the forage producing possibilities of cut-over lands. Similar organizations had been perfected in Florida, Georgia, and North Carolina. Cattle ranches were being established in this territory, and interest was being shown by Western sheep ranchmen in the possibility of extending their operations not only into the Southern cut-over lands, but into those of the North as well.

With the beef cattle development in the South, packing plants were being established throughout that territory.

**THE SIX-DAY MARKET.** An important step in marketing live stock for slaughter was the establishment of a zone system of shipment, with the markets open six days in the week. One of the evils of the meat animal business during recent years was the tendency for receipts on the primary markets to be concentrated on three days of the week, often with a reduction to two days. This practice had resulted in railway congestion, in congestion in the yards, and had been thought by many to be responsible for some of the sudden slumps in prices. In November the Food Administration issued regulations to put into effect a zone system of handling receipts on the Kansas City market, thus establishing a six-day market with advantageous regulation of the traffic, and the results were so satisfactory that it was extended to the Chicago market. The effect was expected to be beneficial to the entire live stock industry.

**THE OUTLOOK.** The future outlook for the animal industry in the United States, viewed from every possible angle, at the end of 1917, was extremely promising. The demands on animal producers from the patriotic standpoint and as a duty to our Allies were being given due weight, and the obligation was stimulated by the prospect of substantial profit. Breeders felt that the call was not only immediate, but that the coming of peace would necessitate still further demands on American flocks and herds to restock European farms. See **LEATHER**.

**STOCKS AND BONDS.** See **FINANCIAL REVIEW**.

**STOTT, HENRY GORDON.** An American electrical engineer, died in New Rochelle, N. Y., January 15, 1917. He was born in 1866 in the Orkney Islands, Scotland, and was educated at Edinburgh at Watson's College School, and in Glasgow at the College of Science and Arts and the Glasgow and West of Scotland Technical College. His early engineering experience was

gained in Scotland, England, and Spain, during which period he held various positions and did much experimental work. By 1891 he had settled in the United States as engineer with the Buffalo Electric Company, for which he did important construction work. Since 1901 he had been superintendent of motive power for the Interborough Rapid Transit Company in New York, and since 1912 had served the New York Railways in a like capacity. Mr. Stott was a member of numerous engineering societies, and in 1907-08 was president of the American Institute of Electrical Engineers.

**STRACCIARI, RICCARDO.** See *MUSIC, Opera*.

**STRAITS SETTLEMENTS.** A British crown colony in Malaysia, composed as follows:

	<i>Sq. M.</i>	<i>Pop., 1911</i>	<i>Pop., 1916</i>	<i>Capital</i>
Singapore ...	307	311,985	358,912	Singapore
Penang ....	571	278,003	294,858	George Town
Malacca ....	720	124,081	141,444	Malacca
Total.....	1,598	714,069	795,214	Singapore

The settlement of Singapore includes the island of Singapore (217 square miles), Christmas Island (62 square miles), Labuan Island (28 square miles), and the Cocos or Keeling Islands, the largest of which is five miles by one-fourth of a mile. The area of the Cocos is not included in the foregoing table. The settlement of Penang includes the island of Penang (108 square miles), Province Wellesley (280 square miles), on the Malay Peninsula, and the Dindings territory (183 square miles). Malacca is on the mainland of the peninsula. The population of Singapore Island is gathered chiefly in the city of Singapore, one of the principal ports of the East. The colony produces tapioca, rice, and rubber (chiefly in Malacca and Province Wellesley), and sugar (in Province Wellesley). Coal is mined in Labuan. Trade statistics are given below in pounds sterling:

	<i>Imports</i>		<i>Exports</i>	
	<i>1914</i>	<i>1915</i>	<i>1914</i>	<i>1915</i>
Singapore .....	33,799,827	40,289,133	27,591,480	35,995,659
Penang .....	13,621,595	13,412,613	12,069,406	12,012,256

Revenue, 1915, £1,648,697 (1916 estimate, £1,362,192); expenditure, £1,189,598. The debt stood January 1, 1916, at £6,913,352.

**STREET TRAFFIC.** See *CITY PLANNING*.

**STRIKES.** The year 1917 was not notable for any strikes of unusually spectacular character, yet labor disturbances were numerous, perhaps three times as numerous as usual, and some of them, as those in copper mining and shipbuilding, had important consequences because of their relation to essential war industries. Opinion continued to favor industrial arbitration and conciliation (q.v.) and new machinery to these ends was set up. The Industrial Workers of the World were prominent in numerous labor disputes. In September President Wilson appointed a commission consisting of Secretary of Labor William B. Wilson, J. L. Spangler of Pennsylvania, and Vernon Z. Reed of Denver, business men, and John H. Walker and E. P. Marsh, respectively heads of the Illinois and Washington

State Federations of Labor, to investigate the labor situation in the West and Southwest, especially with reference to the activities of the I. W. W. (q.v.). A few of the important strikes not mentioned in the articles just referred to are described below. See also *INJUNCTION*; and *LABOR*.

**WAR WORK.** No sooner had the United States entered the war than the labor situation became in some ways fraught with new dangers. There were occasional reports of employers with government contracts reducing wages or lengthening hours or otherwise reducing standards and taking refuge behind the widely-held doctrine that for workers to strike was for them to give aid to our enemies and therefore treasonable. On the other hand the tremendous demand for labor of various skilled kinds was here and there utilized as an opportunity by labor to enforce its demands: and here again the government contract was a factor. Many contracts were let on a "cost plus" basis, that is, cost plus a stipulated rate of profit. Hence the contractor, being in a position of certain reimbursement by the government, and indeed having his own profits increased by increased costs, was easily forced by the organized demand of his workers, frequently by brief strikes, to better terms. Another factor that gave labor when organized an unusual opportunity to secure better terms was the need of extreme haste in the completion of many contracts. In the construction of the army cantonments, for example, many thousands of men at each camp were required at top speed to make things ready before cold weather came, a condition making even the threat of a strike, in view of labor shortage in various lines, quite alarming. These conditions resulting in many strikes in plants engaged on government work very early led to proposals for machinery of arbitration and conciliation. It was widely felt that steps should be taken by the government to standardize labor conditions that must be met by plants engaged on war work and that

contracts should specify that these conditions must be established and maintained. This, however, was not carried out with any completeness owing to the great variety of conditions in different plants and different parts of the country. Solution was sought, however, by plans for mediation and by vigorous efforts to secure the patriotic coöperation of both labor and capital. The Committee on Labor of the Advisory Commission of the Council of National Defense, of which President Gompers of the American Federation of Labor was chairman, appointed, among others, subcommittees on wages and hours; mediation and conciliation; welfare work; cost of living and domestic economy. All these sought to secure the proper standards and to engender the spirit of mutual confidence into industry. Finally there was created through the joint action of the government, the Council of National Defense, and labor organizations, the Labor-Adjustment Commission to be composed of

three representatives of the government, three of employers, and three of employees. Mr. V. Everitt Macy was made chairman by President Wilson. All disputes arising in plants working on government contracts were to be referred to this commission. It was itself to decide all cases involving more than 1000 workers and was to appoint committees to hear and decide disputes of less extent. The awards of the commission or any of its committees were to be binding upon both employers and employees. See **ARBITRATION AND CONCILIATION, INDUSTRIAL.**

**SHIPPING.** A threatened strike in August of 100,000 workers in shipbuilding yards of the Pacific Coast where a strike vote had been taken, as well as distinct dissatisfaction among the labor in yards on the Eastern Coast was largely responsible for the creation of the above-mentioned Adjustment Commission. On August 24 an agreement was signed by all parties submitting questions of wages, hours, and conditions to an adjustment board of three, one to be named by President Wilson, one by President Gompers of the American Federation of Labor, and one by the Emergency Fleet Corporation. Late in September, however, trouble again broke out when 30,000 men working in San Francisco yards walked out on a demand for a 50 per cent increase of wages, and 6500 longshoremen at New York City struck to enforce a demand for discharge of a foreman. About three weeks before this the government had entered into an agreement with the International Longshoremen's Association whereby both the government and shipping companies were bound to recognize union wages, hours, and conditions in each Atlantic, Gulf, and Pacific port and the workers were bound not to strike so long as labor standards were maintained. The agreement provided for adjustment of points of difference by a national adjustment committee consisting of Walter Lippmann representing the War Department, Messrs. Franklin and Raymond representing respectively the foreign and coastwise shipping lines, and T. V. O'Connor, representing the longshoremen. In both cases these agreements were not legally binding upon the strikers themselves, as they had had no part in making the arrangements. Their union officials had, however, by signing the agreements or "labor treaties" placed the membership under obligations. The San Francisco men soon returned to work pending an adjustment of the demand by a board consisting of V. Everitt Macy appointed by the president, E. F. Cary of the Emergency Fleet Corporation, and Alfred J. Berres of the American Federation. Differences of the longshoremen with a foreman named Labardo began in July on account of his overbearing manner. The men on his pier walked out because he refused to allow a workman to go to a drug store to get needed medicine. An agreement was made to arbitrate, Labardo was temporarily removed, then reinstated, while no action on arbitration was taken. The men again struck and for a time refused again to arbitrate their personal differences with the foreman. Finally a committee of the National Labor Adjustment Board, Walter Lippmann and T. V. O'Connor, above mentioned, and R. B. Stevens of the Shipping Board, induced the men to return to work pending arbitration.

**COPPER MINES.** From the standpoint of the industry of the country the extensive strikes

in copper mining areas, especially in Arizona, were among the most important of the year. These strikes were of sufficient importance to cut off production entirely in the properties of the Inspiration, the East Butte, and other companies during the months of July and August, while the production of the Anaconda Company fell from over 28,000,000 pounds in May to 20,000,000 pounds in June, 12,000,000 pounds in July, 11,000,000 pounds in August, and 2,800,000 pounds in September. These strikes were widely attributed to agitators of the Industrial Workers of the World (i.w.w.), but in fact this organization was only slightly involved. The above mentioned commission appointed by the president in September effected a settlement in the Arizona and New Mexico region in October and thereafter in other sections. It was agreed that a committee at each mine consisting of miners should be formed to present grievances to employers; that all strikers should be reemployed except those guilty of seditious utterances; and that the government should appoint an arbitrator to settle disputes regarding facts. The settlement of these strikes put 6000 men producing 10,000,000 pounds of copper per month back to work. An important incidental aspect of these strikes was the determination of some 4000 Mexican miners to return to Mexico.

**NEW YORK CLOTHING TRADES.** Probably the most important strike of the year from the standpoint of numbers of laborers involved was that of nearly 60,000 members of the Amalgamated Clothing Workers of America, engaged on men's and boy's clothing in New York City, who went out on December 13, 1916. They demanded an increase in pay of \$2 per week and a reduction of hours from fifty to forty-eight. They afterwards modified the wage demand to an increase of \$1 per week, and on this basis agreement was made with a group of about 15,000 workers. By the opening of 1917 nearly 25,000 workers had returned under these conditions. The American clothing manufacturers, representing the employers of over 30,000 workers, vigorously resented the demands of the union and sought in various ways to break up the morale of the strikers. About January 10, however, a settlement was effected through the intervention of William O. Thompson of the Arbitration Board formed by the Hart, Schaffner, and Marx Co. of Chicago and Judge Julian W. Mack of the Arbitration Board in the dress and waist industry in New York. The forty-eight-hour week was established and an advance of 12 per cent in wages granted.

**PHILADELPHIA SUGAR STRIKE.** Some 2000 unorganized workmen, nearly all foreigners, Poles and Lithuanians, with a sprinkling of Russians, Germans, and Italians, employed by three sugar refining companies of Philadelphia, struck on February 7 for better pay and altered conditions. They were at once organized by I. W. W. leaders into the Sugar Workers' Union, which formulated five demands: Reduction in hours from twelve to ten per day; time and a half for overtime; double time on Sundays and holidays; general raise of five cents an hour instead of the bonus of 8 per cent on the January wages offered by the companies on the day the strike began; recognition of the right to organize. The companies, three in number, flatly refused to consider these demands, or to meet

a committee representing the strikers. The general manager of the Pennsylvania Refining Co. declared that the strikers had no case, as they were receiving twenty-five cents an hour or \$3 per day; that the strike leaders would be taken back under no circumstances; that others would be taken back if their places had not been filled; that unionization of any sort would be bitterly fought. Strikebreakers were brought in and in addition to pay received board and lodging from the companies. While no strike benefits were available, most of the strikers readily found work elsewhere.

**GREAT LAKES SEAMEN.** For some years there has been nearly continuous controversy between the Lake Seamen's Union and the Lake Carriers' Association. A strike of 10,000 of these seamen employed on the Great Lakes was prevented by the United States Shipping Board in the fall. The seamen had made six demands, including a substantial increase in wages and the abolition of the so-called welfare plan. According to this plan sailors may be hired only through the assembly rooms established in various ports and where certain comforts are provided upon the payment of one dollar per year. Upon the payment of this fee the worker is given a discharge book. No captain may hire a man for lake service who does not possess one of these books. When hired the book is deposited with the captain or chief engineer. When service terminates the book is returned with an entry indicating the character of the service. The book, however, is returned only if the service is good or fair. The union claimed that this system is in effect the maintenance of a black list. The compromise settlement secured the advance in wages, but no modification of the welfare plan. At its convention in December, 1916, the International Seamen's Union had requested the Department of Labor to investigate this plan. In September the Bureau of Labor Statistics announced that such an investigation had been made and that the results would soon be published.

**STATISTICS FOR 1916.** The Bureau of Labor Statistics in April reported a total of 3157 strikes and 108 lockouts during the calendar year 1916. This was more than double the number of strikes, but only 60 per cent of the number of lockouts in the calendar year 1915. The greatest number of strikes occurred in May, April, and June, respectively, these being the months in which the greatest number of trade agreements terminate. Ten per cent of the strikes occurred in New York City. There were also numerous strikes in the vicinity of New York, in Newark, Bayonne, Edgewater, Jersey City, Hoboken, Weehawken, and along the Hudson. Coal strikes throughout the country involved more than 350,000 men. Many of these were in the anthracite region and connected with the disagreement over the eight-hour day and the price of powder. There were also strikes of bituminous coal miners in Pennsylvania, West Virginia, Ohio, Kentucky, Kansas, Oklahoma, and Texas. There were 564 strikes in Pennsylvania; 339 in Massachusetts; 272 in Ohio; 224 in New Jersey; 148 in Illinois; and 129 in Connecticut. In 112 strikes women alone were concerned; while in 225 strikes and 9 lockouts both men and women were involved.

The greater number of strikes occurred in the

following industries: metal trades, 487; mining, 395; building, 348; textiles, 222; transportation, 205; clothing, 187; teaming, 94; baking, 65; and iron and steel, 67.

As regards causes 1076 strikes related to wages; 110 to hours; and 374 to both wages and hours; 257 were for the recognition of the union; and 208 for recognition of the union and wages or hours. There were 121 strikes because of discharge of employees, and 70 because of the employment of non-union men. As to results 471 strikes terminated in favor of employers; 706 in favor of employees; 542 were compromised; in 70 employees returned pending arbitration.

**OTHER COUNTRIES.** In other countries as in the United States there was a great deal of industrial unrest expressed partly by numerous strikes and lockouts, but without labor movements on a large scale. The general strike at Barcelona, Spain, was due very largely to political agitation. In England and France industrial conditions were on the whole quite peaceful, because of the coöperation of the governments with labor leaders, the obvious efforts of the governments to treat labor fairly by adjusting wages to rising costs, and the patriotic willingness of labor to advance the war. The latter motive, however, did not prevent strikes in both countries that were somewhat serious, nor did it prevent labor leaders from advancing repeated proposals for an announcement and discussion of peace terms. The *Labor Gazette* summary of trade disputes in Great Britain for the first ten months of 1917 showed 455 involving 205,600 workpeople, as compared with 538 involving 531,400 workpeople for the same period in 1916. The time lost in 1917 amounted to 2,223,000 days, as against 4,128,000 in 1916.

In Japan a very extraordinary rise in prices resulted in an unprecedented number of labor disturbances. Index numbers based on the prices of foods and other commodities, according to the Bank of Japan, showed a rise of 60 per cent from July, 1914, to July, 1917, and a rise of 41 per cent between July, 1916, and July, 1917. In general strikes were of short duration, employers advancing wages in most cases from 15 to 20 per cent. For government employees repeated advances were made.

In August, 1917, the German Department of Labor Statistics summarized labor disputes in 1916. There were 240 strikes in that year, involving 124,188 workers. The number of disputes compared with 141 in 1915, 26 in 1914, and an average of 2595 in each of the years 1909-1913. The number of workers involved, compared with 12,866 in 1915, 91,140 in 1914, and 327,000 in each of the years 1909-13. The number of working days lost aggregated 245,404 in 1916; this was 5 times the loss of 1915, but less than one-tenth of the loss in 1914, and compared with an average annual loss of 11,190,000 days for 1909-13. Of the strikes in 1916, 11.3 per cent resulted in the workers gaining their demands, 34.5 per cent resulted in demands being wholly rejected, while the remainder were settled partly in favor of employers and partly in favor of employees.

**STUART, RUTH McENERY.** An American author, died in New York May 6, 1917. She was a Southern woman, born in Avoyelles Parish, La., in 1856, and educated in New Orleans. To this city she returned to live for a time

after she had been left a widow by Alfred O. Stuart, the cotton planter, to whom she was married as a girl. Later she made her home in New York. Beginning in 1888, when her first story, *Uncle Mingo's Speculations*, was published in the *Princeton Review*, Mrs. Stuart devoted herself to writing fiction and verse concerned with the South and particularly with the negro. Long and appreciative familiarity with the ways of the old-fashioned "darker" and a keen sense of humor helped to make her one of the most entertaining portrayals of now vanishing types and of types that are perennial. Tulane University acknowledged her contribution to the literature of the South by conferring on her the degree of Litt.D. in 1915. The titles of Mrs. Stuart's books include, *A Golden Wedding and Other Tales*, *Carlotta's Intended*, *The Story of Babbette*, *Solomon Crow's Christmas Pockets and Others*, *In Simpkinsville*, *Moriah's Mourning*, *Sonny, Holly, and Pizen*, *The Woman's Exchange*, *Napoleon Jackson*, *George Washington Jones*, *The River's Children*, *The Second Wooing of Selina Sue*, *Aunt Amity's Silver Wedding*, *Sonny's Father*, *Daddy Do-Funny's Wisdom Jingles*, *The Cocoon*, and *Plantation Songs*.

**STURMER**, BORIS VLADIMIROVITCH. Former premier and foreign minister of Russia, died September 3, 1917. He began his career in the Russian Senate in 1872 after studying law at the University of St. Petersburg (Petrograd). When Czar Nicholas was crowned, Sturmer was called from the governorship of Novgorod and put in charge of the ceremonies. After that he was Master of Ceremonies at the capital for some time. He was elected president of the Board of the Zemstvo in the government of Tver in 1892, but two years later again became the governor of Novgorod. In 1896 he became governor of Yaroslavl. In 1916 he became president of the Council of Ministers, and minister of foreign affairs, succeeding Goremykin. Sturmer with Rasputin and Protopopov, former minister of the interior, were the leaders of the "Dark Forces" of Russia, which were the chief causes of the revolt against the old régime. In June, 1917, after the revolution, he was indicted under a law which provided a severe punishment for arbitrary transgression by an official of the limits of his rightful power. At the time of his death he was incarcerated in the fortress of St. Peter and St. Paul. Disclosures made by the Russian revolutionists show that Sturmer betrayed Rumania to the Germans. The plans of the latter country's operations were in the hands of the Germans before the operations began. The promise that a Russian army was to support the Rumanian divisions in the Dobruja was broken and the Rumanians were left to the mercy of von Mackensen. See *RUSSIA, History*; *WAR OF THE NATIONS*.

**STYRIA**. A crownland of Austria. Area, 8658 square miles. Population at census of December 31, 1910, 1,444,157 (5.05 per cent of the Austrian total). Austrian subjects in 1910, 1,394,699; of these, German was the vernacular of 983,252 (70.50 per cent); Slovenian, 409,684 (29.37 per cent). Catholics formed 98.06 per cent of the population. The capital is Graz (estimated population June 30, 1914, 156,500). The crownland has a diet of 87 members and is represented by 30 members in the Austrian Reichsrat.

**SUBMARINE BOATS**. See **BATTLESHIPS**,

ETC.; **NAVAL PROGRESS**; **SUBMARINES**; **SUBMARINE OPERATIONS**.

**SUBMARINE OPERATIONS**. When, in February, 1915, the German campaign against merchant shipping was first launched, it was immensely popular, both with the nation and the navy. It was looked upon by the people at large as a Roland for Great Britain's Oliver—the blockade of the German coast. Service in the submarine branch was encouraged by increased pay, promotion, honors, decorations, and prize money for ships sunk. Volunteers were plenty and the service popular. The sinkings increased from an average of five a week in March to twenty-two a week in August, and then steadily dropped to two a week in October. The reduction was brought about by several causes. First, the British submarine nets, submarine chasers, patrols, and destroyers were said to have disposed of 50 per cent of all boats that had been completed previous to September 1, 1915. To these losses must be added a considerable number sunk by mines, by running aground, by internment in neutral ports, and by foundering because of defects in hull, machinery, or equipment.

While the magnitude of the losses could be concealed from the German people, the personnel of the navy could not be deceived. Even the more ignorant of the enlisted men were tolerably sure of the facts. They had seen boat after boat sail away and never return. It required no mathematics to deduce the danger of the service. It began to be noised about that submarine duty was not dangerous—it was fatal; that any man who survived a year of it was endowed with marvelous luck. Volunteering stopped entirely and the new crews were drafted from the fleet. As these were green hands it became necessary to establish larger schools for the instruction of officers and men to replace those who were disappearing so fast. Long before this, the naval authorities realized that the boats were too small, too weakly armed, too few in number. New and larger boats were put in hand while the campaign was no longer pressed. Such large boats as were available were sent to the Mediterranean, where the field of operations was wider if less intensive and the anti-submarine defense far less effective.

During the five months between October 1, 1915, and the end of the next February the number of boats was heavily increased. Much more than half of the new craft were of 800 tons or greater. Small boats were built for use only in favorable localities or for mine-laying. All were much improved, particularly in matters of defense, habitability, safety of navigation, and propelling machinery. During this reactionary period the Entente Allies and the neutrals became convinced that the danger of the submarine menace was decreasing and the German people were losing faith in the submarine as a decisive factor in the war. By January, 1916, the number of new boats had reached a figure satisfactory to the Pan-Germanists, led by Tirpitz and Reventlow, and they demanded a renewal of submarine operations on a great scale with all humane restrictions as to non-combatants removed. They carried the day against the wishes of a large part of the government, including, it is believed, the chancellor.

In February, 1916, just as the United States was congratulating itself on the favorable con-

clusion of the *Lusitania* affair, in which Germany acceded to the demands of the United States government—disavowal, indemnity, and assurances against similar attacks in the future, the new threat was launched. This declared (Austria, February 10; Germany, February 12) that after March 1, 1916, the Central Allies would regard armed merchantmen as belligerents and torpedo them without warning. The new offensive developed slowly. Tirpitz and his followers were wholly dissatisfied and urged unrestricted warfare against all vessels trading with the Entente countries. This was refused and Tirpitz resigned on March 16. His successor, Vice-Admiral von Capelle, continued the campaign.

On March 24, the Cross-Channel passenger steamer *Sussex*, with about twenty-five Americans among its passengers, was sunk without warning. On April 20, after some diplomatic correspondence, President Wilson informed the German government that unless it would declare and effect an abandonment of its existing methods of submarine warfare, the United States would sever diplomatic relations. On May 5, the German government acceded to the United States demands and stated that "vessels both within and without the area declared a naval war zone shall not be sunk without warning and without saving human lives unless the ship attempt to escape or offer resistance." But, if the United States should fail to secure "freedom of the seas" from Great Britain, "the German government would then be facing a new situation in which it must reserve to itself complete liberty of decision." The campaign against Entente and neutral merchantmen—especially the latter—was greatly checked during the American negotiations and for about three months thereafter, but was resumed with increased energy at the end of July, culminating in November when 152 belligerent and 68 neutral vessels were sunk. In December and January the destruction of neutral vessels exceeded that of belligerents in the proportion of nearly two to one. This variation in submarine activities much reduced the peril of submarine work, for no danger was to be apprehended from neutrals and attacks on enemy vessels were confined to the safer sort. The diminution of the numbers engaged, the fewer losses, and the less arduous character of the work somewhat lessened the antipathy to submarine service and formed part of an extensive preparation for the great campaign already planned for 1917.

On January 31, 1917, without previous warning, the German government announced its intention to abandon, within certain defined areas, the restrictions imposed by international law, humanity, and the customs of centuries. In the prescribed areas or zones, which included nearly all the waters of Europe except the Baltic and its approaches and the coast of Spain, "all sea traffic forthwith will be opposed." The zones were defined as follows (the published translations not being very clear as regards the limits between the coast of Norway and the Faroe Islands, the assigned lines in this locality may be slightly incorrect):

In the North Sea, the eastern boundary line begins abreast the southwest corner of Holland and runs along the Dutch coast at a distance of 20 nautical miles to the longitude of the

Terschelling lightship; thence due north to Ut-sire I., Norway; thence to a point in lat. 62° N., long. 3° (or 5°) E.; thence along the parallel of 62° to 5° W. long.; thence to a point 3 miles south of the south point of the Faroe Islands; thence to 61° N., 15° W.; thence to 57° N., 20° W.; thence to 47° N., 20° W.; thence to 43° N., 15° W.; thence to the eastward along the parallel of 43° N. to a point 20 miles from Cape Finisterre, Spain; thence eastward at a distance of 20 miles from the Spanish coast until the line reaches the coast of France.

All the Mediterranean was made a barred zone except that portion lying west of a line drawn from a point just to the eastward of Cette (France) to 38° 20' N., 6° E., and north of a line extending along the Algerian coast (at a distance of 60 miles) from the Morocco frontier to 38° N., 6° E. Between the two geographical points thus defined a lane 20 miles wide extends eastward to Greece. Its limits on the side of the African shore are: 38° N., 6° E. to 38° N., 11° 30' E.; thence to 34° N., 11° 30' E.; thence to 34° N., 22° 30' E.; thence north to Greek territorial waters.

One American vessel per week was to be allowed to pass through the northern zone if the United States government guaranteed that she would carry no contraband, if she arrived on Sundays and sailed on Wednesdays, if she went to Falmouth (England) only, if she kept a course between the Scilly Islands and a point 50° N., 20° W. in going and coming. On February 3, Count von Bernstorff (Ambassador to the United States) announced that as a concession any American ship not carrying contraband could use the Falmouth Lane. As a concession to Holland, the eastern boundary of the North Sea area was moved to the meridian of 4° E.

As already stated, the campaign instituted in accordance with this proclamation was in outrageous violation of international law, the rights of neutrals and noncombatants, and the customs of two centuries of naval war. To acquiesce in the admissibility of such warfare was to destroy international law and national safety.

The United States government, which had been patient beyond all precedent, could no longer permit its rights to be assailed and its citizens murdered. Diplomatic relations were at once broken off and, on April 6, 1917, war was declared against Germany. A large force of destroyers and patrol vessels was sent to Europe, where they arrived on May 4. The effect of this very considerable addition to the Allied submarine flotilla was marked. The increase in the weekly sinkings was at once checked and the numbers began to fall. This reduction was further assisted by other important factors, the chief of which was the arming of Allied merchantmen. Vessels carrying guns and trained crews became so numerous as to cause a revolution in submarine methods.

The attack of large ships by guns was becoming so dangerous to the U-boats that they resorted to the torpedo. This greatly cut down the radius of action of the boats and caused them to return at shorter intervals to their bases. It also threw a severe strain on the German supplies, for a torpedo requires several months to build and adjust. Zigzag steering, the depth bomb, which is dropped on submerged U-boats, and the smoke-box, that can quickly obscure a steamer from the submarine's view,

each played its part. The combined results of the various adverse factors gradually diminished the number of large (over 1600 tons) British vessels sunk each month until, in November, 1917, the average was only thirteen per week, while in one week but a single victim of this size was secured. Moreover, the average tonnage of the ships sunk was lessening. This was probably due to the arming of the larger ships and to their better handling.

Beyond question the German naval authorities at the end of 1917 were preparing to meet the new conditions. Their new boats were larger and faster, and were said to have some hull armor and to carry much larger guns than the older craft. An increase in torpedo supply was naturally to be expected and it was quite likely that the new torpedoes would have a greater range. Two defects the new boats must possess, however. Being larger they would be more easily seen, and they could not be built at the same speed and in the same numbers as were the smaller types. From the outlook at the end of 1917 it appeared that whatever measure of success they could attain must be reached in the first six or eight months of 1918, for, at the end of that time, the patrol fleet of destroyers was to be much increased and would be growing in geometrical ratio. Moreover, unless the U-boat campaign surpassed that of 1917 in effectiveness, the rate of ship production largely would exceed the rate of sinking.

According to British semi-official statements, the British tonnage sunk, in February, March, April, and May, 1917, averaged 450,000 tons. In June the figures fell to 320,000; in July, August, and September, to 200,000 per month. In October, November, and December the reduction in the number of vessels sunk still continued and it was presumed that the tonnage destroyed was no greater—perhaps less—than in the summer. The total thus indicated is 3,320,000. The losses of the other Allies (including the United States) brought the grand total for 1917 (excluding January) to approximately 4,000,000. If the losses for the first half of 1918 should have the same monthly rate as the average of 1917, the total losses for all the Allies between February 1, 1917, and July 1, 1918, would be about 6,200,000. The shipbuilding and accessions of tonnage (German and Austrian ships) during the same interval should be: United States—2,400,000 tons commandeered while building; 1,650,000 tons of new ships completed; 700,000 tons German and Austrian ships seized; 250,000 tons transferred from Lakes and other trades—total, 5,000,000 tons; Great Britain—at least 2,500,000; France—300,000; Italy—200,000; Japan—500,000. Grand total of Allies, 8,500,000; excess of ships completed, February 1, 1917, to July 1, 1918, over those sunk in the same interval, 2,300,000 tons.

If the German sinkings do not rise above the level of the last half of 1917, the excess would be over 3,000,000 tons. While it was probable that the new German submarine fleet would be stronger than ever, it would have to meet the enlarged and constantly growing force of destroyers and large patrol vessels. In estimating the total of the United States it was presumed that none of the new steel vessels of the Emergency Fleet Corporation would be finished on July 1, and that 400,000 tons of commandeered shipping would still be under way.

The losses of merchant vessels from striking mines are not included, but the number of ships so destroyed in 1917 was almost negligible, amounting apparently to about 5 per cent of all the ships lost.

The losses of neutrals were not considered in the foregoing discussion, as the available figures were insufficient to warrant review. Norway was the heaviest sufferer, having been despoiled of more than 1,200,000 tons by mine and submarine since July, 1914. Greece and Holland each lost about 200,000 tons; Denmark, 150,000; Sweden, 125,000; Spain, 75,000; and the United States had lost 60,000 before she declared war. Having inadequate shipbuilding facilities of their own, neutrals were replacing but a small part of their losses, and the rate of sinking must decrease from lack of ships to sink. Moreover, many of their weaker and more vulnerable vessels had become engaged in less remunerative but safer trade, far from the scenes of submarine activity, in regions from which Allied ships had been withdrawn by the exigencies of war. See accompanying tables; BATTLESHIPS, ETC.; NAVAL PROGRESS; UNITED STATES AND THE WAR.

TABLE SHOWING THE NUMBER OF BRITISH MERCHANT SHIPS SUNK EACH WEEK BY GERMAN SUBMARINES AND MINES FROM FEB. 1 TO DEC. 23, 1917.

Week Ending	Over 1,600 Tons	Under 1,600 Tons	Week Ending	Over 1,600 Tons	Under 1,600 Tons

AVERAGE NUMBER OF BRITISH MERCHANT MEN SUNK PER WEEK BY ENEMY SUBMARINES IN EACH MONTH OF 1917: ALSO THE HIGHEST NUMBER SUNK IN ANY WEEK OF EACH MONTH.

Month	Average Weekly Sinkings	Highest Number in any Week	Month	Average Weekly Sinkings	Highest Number in any Week
February	16	..	August	16.3	19
March	15.2	18	September	12.8	20
April	26.4	40	October	13.3	14
May	19.5	24	November	2.0	13
June	20.0	27	December	13.8	16
July	16.8	21	For the year	16.8	40

**SUBMARINES.** At the end of 1917, half the German submarines were believed to be of about 1000 tons submerged displacement. The other half was made up of boats of 500 to 800 tons, mine-layers of small size, boats of 1200 tons

carrying three 3.46-inch guns or two 4.1-inch, and somewhat larger boats carrying two 5-inch. Still larger ones, fitted with 6-inch guns, were reported; and a shell fired by a German destroyer at a town in the Azores was said to have been of 6-inch calibre, but the statement lacked confirmation. In 1916, boats of 2400 tons were thought to be building in Germany, but in 1917 they had not appeared where they could be recognized. Judging from boats in service since, Germany had at that time fixed on a displacement of about 1000 tons as a size large enough to give the speed, armament, radius of action, and habitability required. It is always desirable to keep the dimensions as small as practicable, as large boats cost more money than small ones—both to build and to run; they take longer to build, require larger crews, take longer to submerge and emerge, are less easy to manoeuvre, and are more likely to be seen by their enemies. Guns of 2.95 or 3.46 inches calibre were carried, the larger size being considered a trifle heavy. Improved machinery had increased the speed. All this supposed perfection was thrown away by the general arming of merchant ships, for submarines were opposed to guns of five and six inch calibre. Destroying ships by gunfire became less and less frequent and many attacking submarines were sunk by merchantmen. Two courses remained open. The submarines could use torpedoes only; or a larger type could be built which would carry heavier guns and some armor protection over the hull. Germany was unprepared for a torpedo campaign, but she had, temporarily at least, been forced to pursue it; but if the reports of large submarines were correct she intended to come back to gunfire as far and as soon as practicable. Moreover, the large guns might give the submarine a chance with the destroyer under favoring conditions.

During the year Great Britain and the United States were building several submarines of 1500 to 2000 tons and one or more British boats of this size had been completed, though the great majority were of 500 to 1200 tons. During 1917 the United States navy laid down a large number of coastal destroyers of about 800 tons, a size that was considered suitable for ordinary defensive operations. See SUBMARINE OPERATIONS; NAVAL PROGRESS.

**SUDAN, ANGLO-EGYPTIAN.** An African country situated between Egypt and Uganda, and bordering Abyssinia on the east and the northern part of French Equatorial Africa on the west. The capital is Khartum. The Anglo-Egyptian Sudan came under the joint British and Egyptian administrations in virtue of a convention signed January 19, 1899. The area of the country is stated at 984,620 square miles. The population is roughly estimated at between three and four millions. The principal towns include Khartum (with 23,083 inhabitants in 1916), Omdurman, the old Dervish capital (59,429), Khartum North (15,973), El Obeid, Halfa, Meoré, Port Sudan, Suakin, etc.

The Sudan produces cotton, dates, sesame, vegetable ivory, senna, rubber, ground nuts, gums, hides and skins, ivory, and ostrich feathers. It is the chief source of the world's supply of gum arabic. Extensive irrigation plans have been carried out. The reported values of imports and exports in 1915 are £1,704,250 (in-

cluding government stores) and £1,577,991 respectively.

The Nile and its tributaries afford steamer communication. There is a railway from the Egyptian frontier at Wadi Halfa to Khartum. A branch to the Red Sea at Port Sudan was opened in 1905, and a branch to Sennar and El Obeid in 1912. The total mileage is about 1500. For the year ending December 31, 1916, a gross revenue of £E.824,957, in comparison with £E.592,683 in 1915, was reported. The expenditures increased from £E.382,204 in 1915 to £E.522,204 in 1916, the cost of coal in particular being £E.182,688, against £E.74,764. The acting governor-general in 1917 was Col. L. O. F. Stack. The country is divided into fourteen provinces administered by governors.

**SUGAR.** The outlook for the total sugar crops of the world for the season 1917-18, according to the estimates of Willett and Gray, was for a production of 16,770,250 tons, an increase of nearly 188,000 tons over the season 1916-17. These crops were as usual largely prospective, since the harvest period in most of the large cane producing countries does not begin until October and in the Tropics extends several months over into the following year. The estimate for cane sugar was placed at 12,033,750 tons, as compared with 11,268,849 tons in 1916-17 and 10,684,997 tons in 1915-16. The beet sugar crop, on the other hand, showed a falling off from 5,077,760 tons in 1916 and 4,566,408 tons in 1916, to 3,849,000 tons in 1917. This was due to so much of the beet sugar area in Europe being involved in the war. In the United States the beet sugar crop was estimated at 875,000 tons, an increase over 1916 of more than 140,000 tons.

The Louisiana and Hawaiian crops of cane sugar, estimated at 225,000 and 525,000 tons respectively, were somewhat below the previous year, but the Porto Rican crop of 475,000 tons was higher than in 1916, and the Cuban crop was apparently equal to the record crop of 1916, or over 3,000,000 tons. The estimated production in the other leading countries was as follows:

British West Indies, 190,000; French West Indies, 80,000; San Domingo, 145,000; Mexico, 35,000; Central America, 25,000; Demerara (exports), 120,000; Peru, 265,000; Argentina, 150,000; Brazil, 375,000; British India, 2,760,000 (consumed locally); Java, 1,800,000; Formosa and Japan, 450,000; Philippines (exports), 271,250; Australia, 265,000; Fiji Islands (exports), 100,000; Egypt, 100,000 (consumed locally); Mauritius, 224,000; other African countries, 210,000; and Spain, 6000 tons.

In the fall of 1917 the United States faced an actual sugar shortage, much difficulty being experienced in procuring household supplies. For the first time sugar appeared on the menus of some hotels as an extra, for which a special charge was made. The action of the Food Administration, however, served to keep down the price and to regulate the supply. The shortage was attributed quite largely to the fact that foreign governments through their extensive purchases in the United States had reduced the reserve supply of last year to a narrow margin. The difficulty was accentuated by consumer hoarding and by the abnormal amounts of sugar used in the home canning campaigns conducted extensively over the country.

The sugar export of the United States had increased enormously since the war began. It reached its height in 1916, but in 1917 it amounted to 1,254,551,280 pounds, or eighteen times as much refined sugar as in any year before the war. In 1916, 70 per cent of all the sugar exported to the Allies went to England, but in 1917 62 per cent of these exports was taken by France. South America, which prior to the war purchased 1,000,000 pounds from the United States, took 142,858,818 pounds in 1917.

The International Sugar Committee was formed early in the fall of the year to arrange for the distribution of the available sugar in the world. Two members were appointed by the Allied governments and two by the United States Food Administration, which was also represented on the committee by the head of the sugar division. It was the duty of this committee to arrange for the purchase and distribution of all sugar, whether for the United States or the Allied countries. This committee passed upon the export of sugar, and the importation of this commodity into the United States was placed under license of the War Trade Board by executive order the last of November.

In December the United States Senate directed an inquiry into the causes of the shortage of sugar, which was in progress at the close of the year.

The consumption of sugar in Europe had been greatly reduced. England, which formerly used 93½ pounds per capita annually, had cut the amount to 28 lbs., while France and Italy had reduced the amount to 18 and 12 pounds respectively. In the United States as high as 90 pounds a head per year had been used, but the amount fell under high prices and regulation of that used by confectioners. The Food Administration proposed a reduction to 67 pounds per capita annually. It was stated that two-fifths of all the sugar consumed in the United States was used in candy.

At the close of 1916 it was announced that the government of Panama was authorized to loan a half million dollars to sugar plantation operators or to guarantee loans to that amount, these loans to be repaid within ten years. A subsidy was granted of half a cent per kilogram of white granulated sugar produced in that country. Great Britain made a grant of \$625,000 from its Development Fund as a loan for the development of sugar-beet growing and manufacture in England. See **CHEMISTRY, INDUSTRIAL; FOOD AND NUTRITION; FOOD CONTROL.**

**SUN.** See **ASTRONOMY.**

**SUNDAY SCHOOL UNION, AMERICAN.** A voluntary association of Christians of different denominations, established to teach fundamental Christian truth, especially to the young. It was founded in Philadelphia in 1791 under the name of the First Day Society, but its present title was assumed in 1824. Its practical purpose is to found Sunday schools and to circulate Bibles, New Testaments, and other religious literature. During the fiscal year ending March 1, 1917, the American Sunday-School Union commissioned 255 missionaries, established 1313 new Sunday schools, and reorganized 694, and into all these schools were gathered 6952 teachers and 65,608 scholars. In addition to their pioneer work, the missionaries have visited 14,394 schools in which 72,949 teachers and 879,082 scholars have been influenced; and while thus engaged

they distributed 7063 Bibles and 19,096 New Testaments. The combined circulation of nine different Sunday school periodicals in 1917 was 2,149,231. Out of the Union Sunday schools in 1917 there have grown 86 churches of various denominations; 405 Young People's Societies and Prayer Meetings have been established, and 7794 conversions reported. The centenary celebration of the beginning of organized Sunday school work in America, was held in May, 1917. The officers in 1917 were: President, Martin J. Finckel; secretary of missions, G. P. Williams; financial secretary, E. P. Bancroft; treasurer, J. E. Stevenson. The chief offices are in Philadelphia.

**SUNSET DIVISION.** See **MILITARY PROGRESS.**

**SUN SPOTS.** See **ASTRONOMY.**

**SUPERHEATER.** See **RAILWAYS.**

**SURGERY.** See **MILITARY SURGERY.**

**SWARTHMORE COLLEGE.** A non-sectarian co-educational institution located at Swarthmore, Pa. It was founded in 1864 by the Society of Friends (Quakers). In the fall of 1917 there were 484 students and 49 members of the faculty. Volumes in the library numbered 35,000. Walter Dennison, professor of Greek and Latin, died in 1917. Addition was made to the endowment of \$375,000 and \$50,000 was added to the Women's Dormitory Fund. President, Joseph Swain, LL.D.

**SWAZILAND.** A British protectorate in South Africa, situated at the southeast corner of the Transvaal and north of Zululand. Area, 6536 square miles. Population (estimate of March 31, 1914), 107,117. The staple product is corn; other crops are tobacco, millet, ground nuts, sweet potatoes, and beans. There are about 73,000 cattle, 170,000 native sheep, and 9000 swine. Tin and gold are mined. The tin output in 1915-16 was 584 tons valued at £56,067; gold, 6497 ounces, £29,595. Swaziland is included in the customs territory of the Union of South Africa, and separate trade returns are not shown. Administrative headquarters, Mbabane. Paramount chief, Sobhuza (regent, his grandmother, Nabotsibeni).

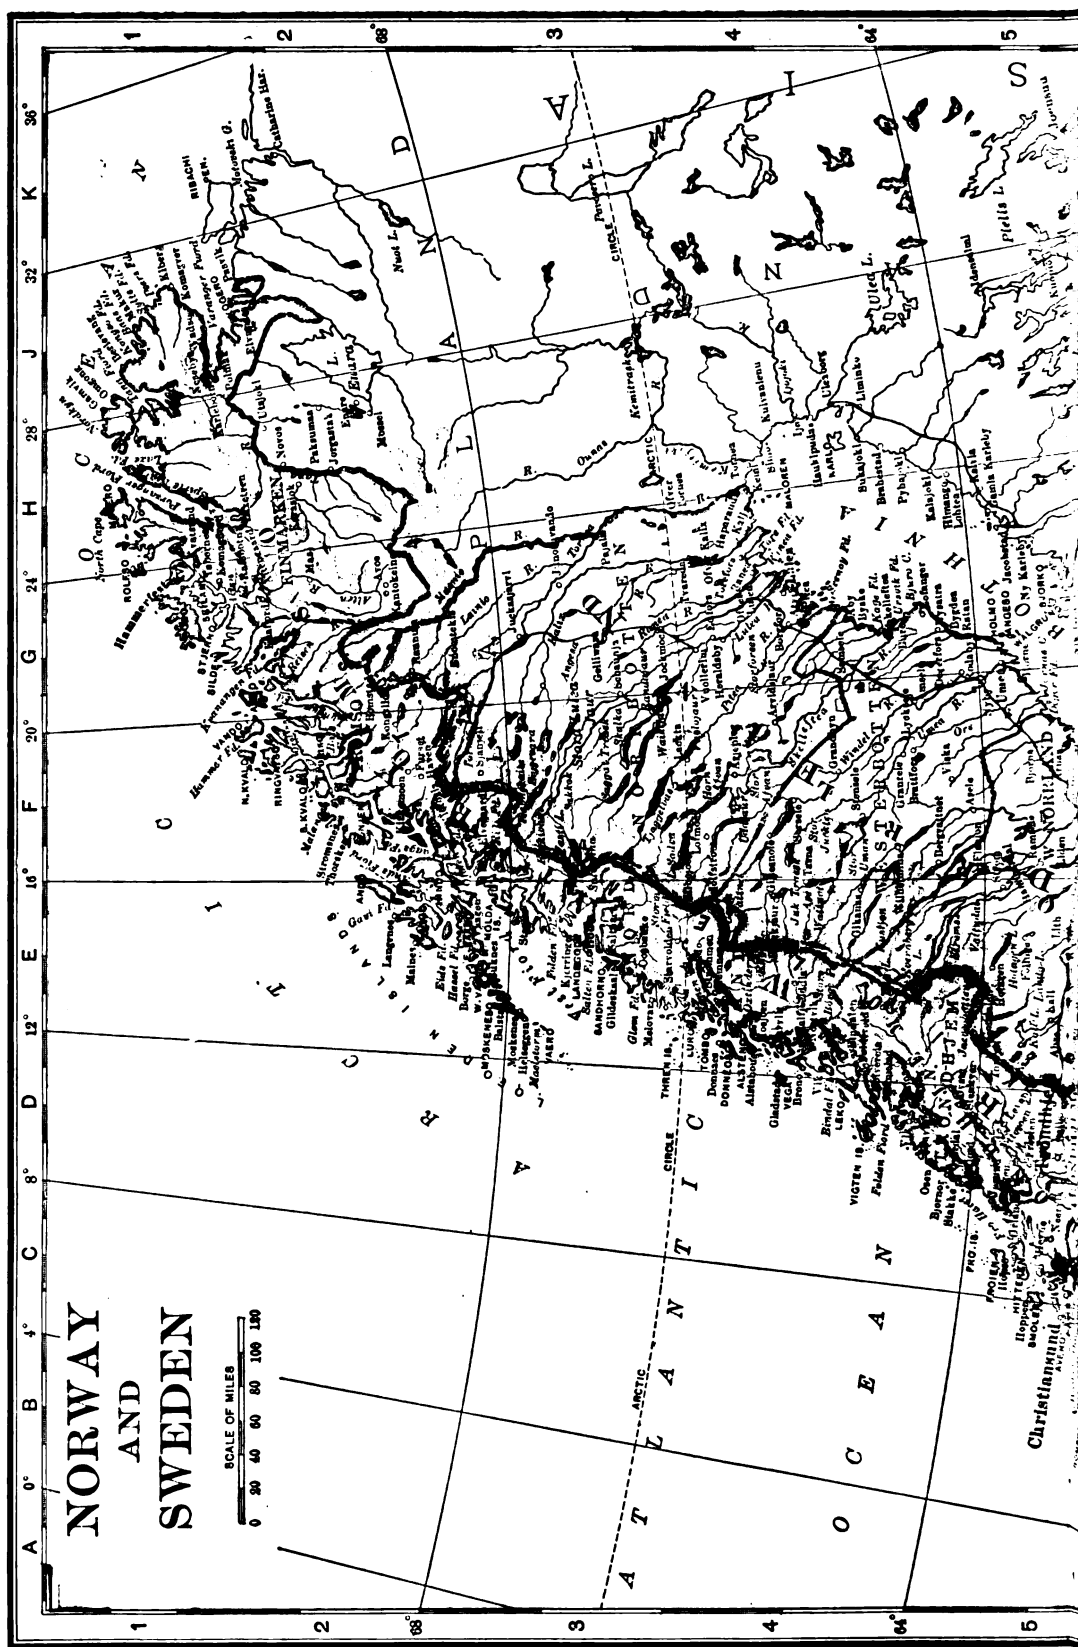

**SWEDEN.** The kingdom of Sweden occupies the largest (eastern) division of the Scandinavian Peninsula, in the northwestern part of Europe. The land boundaries are those dividing it from Norway and Finland. The Gulf of Bothnia, the Baltic Sea, the Sound, the Kattegat, and the Skager-Rak form the eastern, southern, and part of the western boundaries. Although 15 per cent of the area lies north of the Arctic Circle, the rigors of a northern climate are ameliorated by the warmth of seas affected by the Gulf Stream.

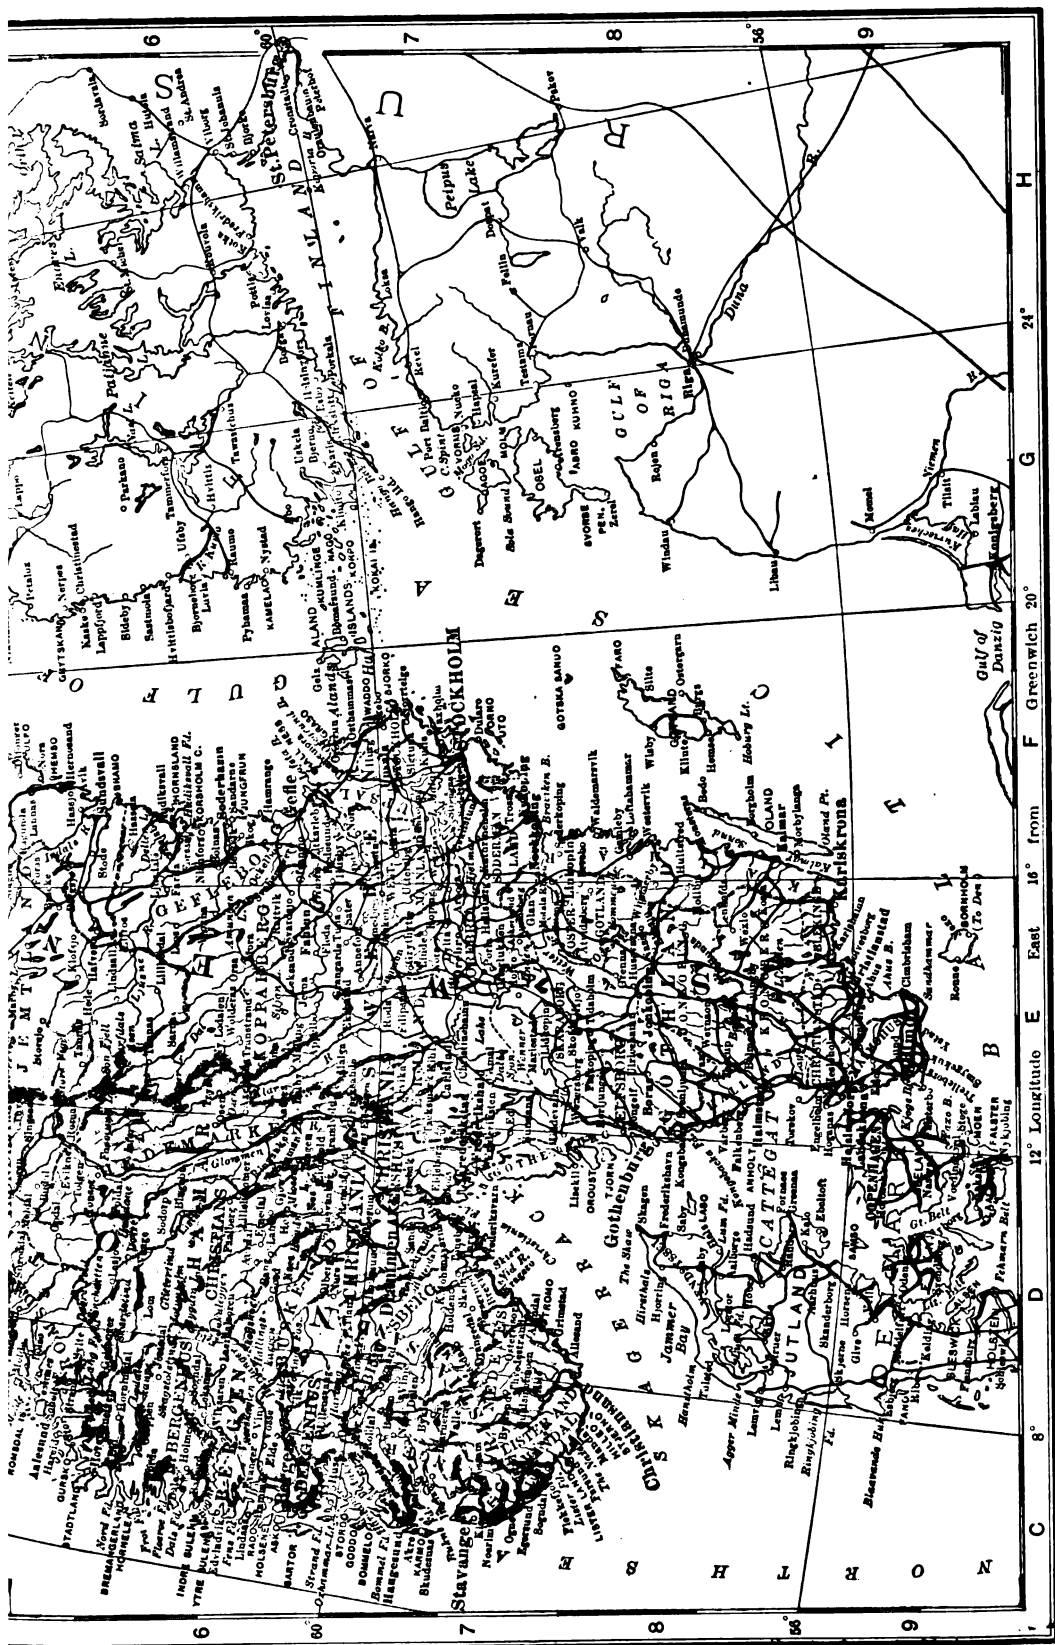

Toward the European war, Sweden's attitude was that of a neutral, though the reigning family and many among the nobility exhibited pro-German leanings.

**AREA AND POPULATION.** The population is, in the northern regions, thinly scattered. The people belong to the Germanic branch of the Aryan family. The land area in square kilometres is 410,353.6 and the population on January 1, 1915, 5,679,607.

The population of Stockholm City as calculated December 31, 1916, was 408,792; of Stockholm prefecture, 225,731. The total population of Sweden was calculated on that date at 5,757,566—a density of 33.3 to the square mile.

Density in Stockholm (city), 7,713; in Malmö, the prefecture showing greatest density, 256.3; in Norrbotten (the least), 4.3. Males (1916) numbered 2,817,950; females, 2,939,616.

Total births are given provisionally for 1916 at 121,214; deaths, 77,683; marriages, 35,156.

Besides Stockholm, the principal cities are Göteborg, with a population at end of 1916 of 191,535; Malmö, 111,823; Norrköping, 55,623; Gävle, 36,623; Hålsingborg, 35,783; Örebro, 34,453; Eskilstuna, 30,111; Karlskrona, 28,556; Jönköping, 28,765; Upsala, 27,976.

The urban population is calculated at 26 per cent of the whole—a low rate as compared to the rest of Europe. The capital, Stockholm, is the principal import town as well as the home of a majority of the principal manufacturing interests.

**SOCIAL CONDITIONS.** The question of nationwide prohibition of the manufacture and sale of intoxicants had reached Sweden and the need for radical measures was realized. The total amount of spirits consumed in 1912-13 was 387,289 liters (at 50 per cent), or 6.7 liters per inhabitant; of beer 1,156,391 liters, or 20.6 liters per inhabitant. Sentenced for drunkenness in 1911-12, 56,622. This figure does not include those sentenced for crimes whose commission was directly or indirectly traceable to drunkenness. The Royal Temperance Committee issued proposals in 1914 for radical reforms, which failed of adoption in the legislature; but the question of restriction of manufacture and sale continues to be agitated.

The movement for woman's suffrage advances in Sweden, as in most other civilized countries. The Swedish National Woman Suffrage Union now numbers 213 local associations, with 17,000 members. This and kindred associations have a total membership of 35,000.

**EDUCATION.** The public elementary schools are parish institutions, with grants-in-aid from the state. The compulsory period is 7 to 14; but children who at 14 have not attained the required standard are obliged to continue beyond that age. Elementary schools in 1914 numbered 15,773, with 23,495 teachers and 813,433 scholars. State expenditure for the year, 13,476,454 kronor, out of a total of 50,645,795 kronor. Secondary (public) schools (1915), 77, with 24,828 pupils; people's high schools, 48, with 2704; normal schools, 15, with 1953.

**AGRICULTURE.** Not a large proportion of the soil of Sweden is favorable to cultivation; and the climate, with its short growing period and early frosts, makes the harvest precarious. It is estimated that 12 per cent only of the area is under crops and meadows; yet upon that 12 per cent, according to the census of 1910, 2,663,000, or 48.23 per cent of the population, exists, as against 2,756,704, or 53.67 per cent in 1900, and 2,995,844, or 71.87 per cent in 1870.

The forest lands constitute one of the greatest sources of the country's wealth, the export of timber being nearly half the total exports. Instead of exporting grain, Sweden imports it in increasing quantities.

In view of the shortage in food supplies, a comparison of ante-war live stock conditions with those of subsequent years is of interest. The very high prices of cattle, from the opening of the war, encouraged breeding. The census of June 1, 1916, given in detail herewith, shows that the number of cattle, especially those of

young stock, has not only been maintained, but even increased. Oxen, bulls, and cows are the only classes showing any reduction in number for 1916, as compared with 1913.

	June 1, 1916	Dec. 31, 1914	Dec. 31, 1913
Horses over 3 years..	523,128	501,370	497,243
Horses under 3 years	177,971	101,248	98,893
Oxen .....	76,805	134,000	130,000
Bulls .....	44,437	51,466	51,323
Cows .....	1,769,689	1,845,989	1,841,991
Young stock .....	1,022,228	729,333	688,427
Sheep .....	1,198,369	998,481	988,163
Goats .....	131,788	77,174	71,054
Pigs .....	1,065,396	1,014,683	967,684

**COMMERCE.** The average annual value of the trade for periods cited, with the figures for 1914 and 1915, are given below, in thousands of kronor:

	1836-40	1876-80	1906-10	1914	1915
Imports ..	27,216	268,506	644,740	726,908	1,142,505
Exports ..	29,887	209,856	515,362	772,355	1,316,864

The principal classes of imports and exports in the 1915 trade, with values in kronor, are given as follows:

	Imports	Exports
Textile mfrs. ....	62,772,523	37,745,238
Cereals and flour.....	183,187,548	906,339
Colonial wares .....	61,381,180	19,112,605
Raw textile materials and yarn .....	180,810,548	104,111,842
Minerals .....	19,608,559	105,899,685
Metal goods, machinery, etc. ....	83,470,748	156,085,097
Live animals and animal food .....	37,892,277	182,874,374
Hair, hides, etc.....	67,859,567	28,341,375
Metals, raw and partly wrought .....	84,747,799	186,040,244
Timber, wrought and un- wrought .....	8,485,818	235,597,883
Wood pulp, paper, and mfrs. ....	5,888,492	164,129,024
Various .....	220,422,411	146,521,198
Total .....	1,142,504,965	1,316,864,399

No figures for trade by countries of origin and destination are available for years later than 1914, the preponderance for that year being with the German and British empires.

Swedish exports to the German empire have generally included unwrought timber goods, joinery, paper and paper pulp, stone, iron-ore, bar-iron, other descriptions of iron and steel, herrings, separators, meat, milk and cream, hides, etc. The imports included coffee, tobacco, wheat, rye, oats, seed, wool, paints and dyes, cotton, woolen goods, silk goods, articles of dress, hides, fertilizers, iron and steel, machinery, copper, etc.

Germany, with which country commercial intercourse has been very brisk ever since the days of the Hansa League, has its chief importance for Sweden in the considerable import thence of articles of food and consumption (the greater part of the import of wheat, a considerable part of the import of rye, and the greater part of the import of coffee and tobacco), of raw materials for textile industries, and of a multitude of industrial products.

**COMMUNICATIONS.** At the end of 1913 Sweden had about 14,377 kilometres of railways in operation, with 2200 under construction or conceded. Of this length, 4688 kilometres were

state railways. An English source gives the total mileage at the end of 1915 as 9228; the length of telegraph lines as 40,821 miles; state telephone lines, 228,689; private lines, 117,879. Navigable waterways and canals form an important means of internal communication. The company-owned Swedish railways showed an increase in receipts for the first six months of 1917, as compared with the same period in 1916, of 18.4 per cent on the freight traffic and 9.5 per cent on the passenger traffic. The increase in the freight receipts is exclusively due to the higher tariff temporarily adopted. The private railways contemplated a material reduction in the number of trains during the winter, while the state railways meant to meet the shortage of fuel problem by reducing the speed. During 1917 a further increase of 50 per cent on goods traffic was proposed, making the increase since the beginning of the war 100 per cent.

**FINANCE.** The financial administration of Sweden presents the peculiarity of being divided between two mutually independent institutions—namely, the public treasury, under the management of the government, with the exchequer (*Statskontoret*) as its organ; and the national debt under the control of the *Riksdag*, with the national debt board (*Riksgäldskontoret*) as its organ.

The budget reform of 1911 effected the formal unification of the financial administration by providing that, almost every branch of revenue and expenditure was to be included in the national budget. Side by side with its chief functions of directing a loan policy of the country, managing the national debt, and acting as the financial organ of the *Riksdag*, however, the national debt board still sees to the disbursement of borrowed monies and also manages a part of the state's loan-funds. Budget estimates for 1917: Total revenue, 446,995,100 kr.; total expenditure, 446,995,100 kr. During 1914 all the independent tobacco industries in Sweden, together with the so-called tobacco trusts, were consolidated into one *regie* and taken over by the government. The debt stood January 1, 1916, at 812,608,666 kr. See **FINANCIAL REVIEW**.

**NAVY.** The Swedish fleet consists at present of the following ships: The royal yacht, the *Drott*, 630 tons. War vessels: 12 ironclads (the *Svea*, *Göta*, *Thule*, *Oden*, *Thor*, *Njord*, *Dristighe*, *Aaron*, *Vasa Tapperheten*, *Manligheten*, and *Oscar II*), each of from 3270 to 4660 tons, and the *Sverige*, of 6800 tons; 1 armored cruiser of 4800 tons; 3 second-class ironclads of 1500 tons; 7 third-class ironclads of 460 tons; 5 torpedo cruisers of 840 tons; 4 gunboats of from 400 to 600 tons; 8 destroyers of 450 tons; 31 first-class torpedo boats of from 70 to 120 tons; 22 second-class torpedo boats of from 43 to 86 tons; 2 mining vessels and a number of submarines. Further, training ships, wireless telegraphy ships, work ships, hospital ships, depot ships, and receiving ships, etc., altogether 20, most of them older ships, revamped for their special purposes.

The total tonnage of the warships of the fleet is about 80,000. The number of guns mounted on the warships are somewhat over 500, of which 25 heavy, 132 medium heavy, and the remainder light guns. The total of the indicated horsepower of the warships is about 250,000.

The coast artillery in the widest sense of the

term includes the coast fortresses and positions, namely, Vaxholm and Oscar Fredrikaborg forts, Karlakrona forts, Älvsborg fort, and the coast positions of Färsund and Hörningsholm, with all the fortification works, guns, mines, torpedoes, watch-towers, and other material, together with the naval and military personnel belonging to them.

**GOVERNMENT.** Government measures are decided upon by the king-in-cabinet. The several ministers, on the other hand, cannot decide even minor matters by themselves.

King Gustaf V is the fifth sovereign of the house of Ponto Corvo and great-grandson of Marshall Bernadotte, prince of Ponte Corvo, who was elected heir-apparent of the crown of Sweden by the parliament of the kingdom, August 21, 1810, and ascended the throne February 5, 1818, under the name of Carl (XIV) Johan. He was succeeded at his death, March 8, 1844, by his only son Oscar. The latter died July 8, 1859, and was succeeded by his eldest son, Carl XV, at whose premature death without male children, the crown fell to his next surviving brother, the late King Oscar II, father of the present sovereign.

Gustav V was born June 16, 1858; he married September 20, 1881, Princess Victoria of Baden, and succeeded his father to the throne December 8, 1907. The heir-apparent is Prince Gustaf Adolf, born November 11, 1882, married June 15, 1905, to Princess Margaret of Great Britain and Ireland. The Swedish Cabinet, which began service October 19, 1917, was made up as follows: Prime Minister, Nils Edén; Minister for Foreign Affairs, J. Hellnar; Justice, Eliel Lövgren; Navy, E. K. (Baron) Palmstierna; War, E. A. Nilson; Finance, H. Branting; Interior, P. A. V. Schotte; Instruction, K. V. Rydén; Agriculture, Alfred Pettersson; Without Portfolios, B. Petré, Ö. Undén.

## HISTORY

**RELATION TO THE WAR.** In reply to the suggestion of the United States government that other neutral countries should follow its example in breaking off relations with Germany after the renewal of the submarine war, the Swedish government declared that that method was entirely contrary to its principles of policy. On February 14 it was announced that the Scandinavian powers after a consultation lasting a week at Stockholm, had handed an identical note to the German ministers in Denmark, Norway, and Sweden, protesting against the submarine blockade, refusing to admit its legality, and holding Germany accountable for damages.

**CABINET CRISES.** The government having introduced a measure for the appropriation for 30,000,000 crowns to preserve Sweden's neutrality, the upper chamber voted for it by a small majority, and the second chamber voted against it by a considerable majority; thus the government lost its measure and the Ministry resigned on March 5. The king accepted the resignation of the whole Cabinet under the prime ministry of Hammarskjöld and a new Ministry was formed by Carl J. G. Swartz on March 29. The new prime minister was a conservative in politics and had been minister of finance in the Lindman Cabinet from 1906 to 1911 and was chairman of the budget committee at the time of his appointment. In the new Ministry, Col.

Akerman, who was regarded as one of the ablest of Sweden's military officers, was minister of war. In April the economic condition seemed to be very serious. While the Parliament was in session in Stockholm on April 21, a crowd of workmen numbering several thousand gathered before the building to express their demand that exports be stopped and that foodstuffs be better distributed. Hunger demonstrations were reported at several points in the country. Many people demanded an immediate commercial agreement with Great Britain. The prime minister at the time of this gathering of workmen had just finished a speech on the food situation. In June, 1917, many disorders were reported on account of the scarcity of food. At Stockholm, for example, bands of women went to the retail shops to see whether the provisions were concealed in the cellars; at Gothenburg bake-shops were pillaged; at Norrköping 5000 women demanded bread of the mayor and city authorities and in spite of all efforts to calm them they pillaged a number of the bake-shops. It appeared from investigation afterwards that many of them had been unable to obtain bread for two days. In southern Sweden bands of workmen were reported to be roaming over the country from farm to farm and compelling the farmers to give up their reserve supplies and the peasants were arming themselves to resist these attacks. Moreover, it was said that the army in many places was taking part in Socialist demonstrations. At Stockholm, for example, soldiers in the engineer corps disobeyed orders and attended meetings and the same thing happened among the sailors of the fleet. Among the Socialists the queen was especially unpopular. They called her the German Queen of Sweden, and she was accused of causing provisions to be smuggled into Germany. Many papers contained bitter attacks on the German submarine policy, including some that were regarded as pro-German. On all sides the opinion was expressed that Germany had become totally indifferent to the sympathies of the outside world. The torpedoing of three Swedish vessels seemed to have completely turned around opinion and the policy of Sweden towards Germany.

**CHANGE OF MINISTRY.** In September the government was defeated in the elections and it was necessary to choose a successor to the Swartz Ministry. The personnel of the new government formed on October 19 are given above under *Government*. Upon the nomination of the Cabinet the prime minister issued a statement, of which the main points were as follows: The main task was to maintain strict neutrality as heretofore and absolute impartiality between belligerents. Sweden must continue to develop the collaboration which during the war has been established between the three Scandinavian Powers. The question of reducing national defense must be postponed till after the war, but must then be thoroughly considered. Every effort must be made to take advantage to the extreme of the resources of the country, to encourage and develop production, especially of foodstuffs of prime importance, to smooth the conflicting interests of producers and consumers, and finally to maintain to the largest extent possible the commercial relations with foreign countries.

"The severe times which our people have recently experienced have proven very clearly the

necessity of trying to unite all forces of the nation in a common effort for the well-being of the country through a truly democratic policy in every respect of social life. At the recent election to the second chamber of the Riksdag a great majority has expressed itself favorable to several constitutional reforms, in the first place those which purpose to base the municipal elections on the equal right to vote for every person who pays municipal taxes, further to extend the right of political votes to women, on the same conditions as to men, and, finally, to revise certain regulations of the election law which, at present, restrict the right of voting."

**SWEDEN AND FINLAND.** At the close of the year there was much discussion in the Swedish press of the policy to be followed toward the "new republic of Finland." The Finns had hoped for immediate recognition. In general the Swedish press was friendly, especially the pro-German papers, which since the war broke out had repeatedly urged the separation of Finland from Russia; but in Finland there was suspicion of Swedish designs on the Åland Islands. The "activist" element had been much concerned lest the Åland group, which was nearer to the Swedish coast than to the Finnish and might serve as a base of operations against Stockholm, might become a sort of Heligoland. One of the arguments of those who favored entry into the war on the side of Germany was that in the event of a separate peace between Russia and Germany the latter might get control of Åland. After the collapse of Russia, some even suggested the occupation of the islands by force. This was resented in the Finnish press, which declared that Åland should never be given up.

**SWEDENBORGIANS.** See *CHURCH OF THE NEW JERUSALEM*.

**SWEDISH LITERATURE.** See *SCANDINAVIAN LITERATURE*.

**SWIMMING.** The year 1917 was a banner one for swimming, record after record being shattered by both the men and women adherents of the sport. Norman Ross, a young swimmer of the Olympic Club, San Francisco, headed the list of star performers. Among the new marks he established were: 220-yards, 75-foot pool, 2:22½; 440 yards, 5:16½; 500-yards, 6:05½. Duke Kahanamoku of Honolulu added to his fame as a sprinter during the year by swimming 100 yards in 53 seconds.

Of the new records created by women the most important were the covering of 50 yards in 29½ seconds and 100 yards in 1 minute, 7½ seconds by Miss Dorothy Burns of Los Angeles, Cal., and the doing of 500 yards in 7 minutes, 31½ seconds by Miss Claire Galligan of New York City.

The best achievement in long distance swimming was accomplished by Joseph Gunther of Charleston, W. Va., who covered 27½ miles in still water in 16 hours, 12 minutes. Miss Lucy Freeman of New York City won the long distance laurels among the women by swimming the 15 miles from Spuyten Duyvil to the Battery, New York City, in 3 hours, 59 seconds.

No intercollegiate championships were held, but the Yale team was generally regarded as the strongest college aggregation in the country in swimming, while Princeton had the leading water polo team. The Illinois A. C. for the third successive year proved itself supreme

in water polo, defeating the New York A. C. team in the final game of the championship series by a score of 36 to 33.

**SWITZERLAND.** A federal republic of central Europe. It is the most mountainous country in Europe, having the Alps, covered with perennial snow and glaciers, rising from 5000 to 15,213 feet in height, not only along its southern and eastern frontiers, but throughout the chief part of its interior; and the Jura Mountains in the northwest. The capital is Berne.

**AREA AND POPULATION.** Total area, 41,323,399 square kilometres; *de jure* population (census) of the 25 cantons and demicantons, 3,753,293, and as calculated by the Federal Statistical Bureau for the middle of the year 1915, 3,880,500. Speaking German as their native tongue were 2,599,194; French, 796,220; Italian, 301,323; Romansh, 39,912; other languages, 28,172. Marriages, 1915, 19,527; births, 75,545; deaths, 51,524; stillbirths, 2386. In the same year 1916 Swiss citizens emigrated (1464 in 1916). The communal population of the principal cities will be found in the 1915 YEAR BOOK.

**PRODUCTION AND SUPPLIES.** On January 9, 1915, the Federal monopoly was established for the importation and sale, through the Federal War Commissary, of all grain, including corn and milling products, such as bran, etc., and composition stock feeds. The monopoly's fixed prices gradually rose after December 31, 1915, those established by decree of the Federal Military Department on February 23, 1917, being (per 100 kilos) as follows: Wheat and rye, \$10.81; oats and barley, \$8.11; corn, \$7.72; oat flakes, \$17.37; flour, \$12.59; bran, \$5.40. The Federal Council forbade the grinding of grain into any but whole-wheat flour, for which an official standard was established. The production of white flour and groats (farina) was forbidden, and the stocks were confiscated by the military department. Later the production of a limited quantity of groats was permitted. A monopoly providing for the purchase, importation, and sale through the Federal War Commissary in Berne of rice and its milling products was established. The Federal Council granted on July 27, 1915, to the Association of Swiss Cheese Export Firms, the exclusive right to issue permits for the exportation of cheese. In order to assure the reservation of sufficient milk at a moderate price for general consumption, the council authorized the Federal Economics Department to discontinue the industrial consumption of milk in plants for whose products there existed no actual necessity. In order also to conserve for home consumption the stocks of industrial materials and food supplies fifteen decrees were issued extending the export embargoes. It was decreed that inventories of the supplies of staple articles in Switzerland should be made.

About one-sixth of the area of the country is forest. The area under main crops and yield for two years are shown below:

	Hectares		Quintals	
	1917	1916	1917	1916
Wheat .....	58,099	50,100	1,240,000	1,040,000
Rye .....	22,351	28,900	445,000	508,000
Barley .....	7,679	7,100	155,000	135,000
Oats .....	28,528	41,800	668,000	979,000
Corn .....	1,972	1,500	64,000	38,500
Vines * .....	20,500	21,100	.....	430,000

	Hectares		Quintals	
	1917	1916	1917	1916
Tobacco .....	223	200	4,000	3,800
Potatoes .....	56,750	54,500	9,900,000	5,000,000

\* Yield in hectolitres of wine.

Neither the climate nor the soil is favorable to agriculture. Final results of the Federal census of live stock on April 19, 1916, as compared with those of the census of April 21, 1911, were:

	1916	1911	Difference
Horses .....	186,618	144,128	7,515
Mules .....	8,078	3,151	78
Asses .....	1,275	1,566	291
Cattle * .....	1,615,645	1,448,483	172,162
Sheep .....	171,635	161,414	10,221
Goats .....	358,093	341,296	16,797
Pigs .....	544,021	570,226	26,205

\* Cows 1916, 848,652; 1911, 796,909.

The price of oxen bought at a recent sale (1917) ranged from \$140 to \$480 the pair; bulls were sold for \$160 to \$180 each; cows, \$240 to \$280 each; young cows, \$160 to \$200 each; goats, \$12 to \$16 each; small pigs, \$12 to \$16 each; medium sized pigs, \$40 to \$60 the pair; fat pigs, 32 cents per pound; sheep, \$12 to \$16 each.

The country was organized so efficiently to meet war conditions that its manufacturing industries generally had in 1916 maintained or increased the volume of production in comparison with the preceding year. Imports of foodstuffs, live stock, fertilizer, wood, and cotton declined, and the difficulty in obtaining cotton for the embroidery industry at St. Gall materially reduced the product. Other Swiss factories were enabled to report a satisfactory output by the increased imports of raw silks, metals, and coal. Exports of machinery and textiles, both cotton and silk, in some cases surpassed the previous year's figures. Shipments of Portland cement increased largely during the year. The Swiss watch trade was satisfactory during 1916, figures for the first six months showing improvement in the production and evidence of a gradual return to normal conditions. The policy of the government in conserving the nation's food stock accounts for the small shipments of cocoa powder and chocolate paste, chocolate, condensed milk, and cheese, the last named article declining to 24,587,936 pounds in the first half of 1916, as compared with the export of 44,810,935 pounds in the same period of 1915. In order to obtain the requisite food supplies and fuel and the raw materials for Swiss industries, the Federal government guaranteed that, with certain exceptions, neither imports from one group of belligerents nor articles manufactured from them shall be exported in any form to a country of the opposite group.

In the latter part of 1917 the fact was disclosed that Germany's great gun-makers, the Krupps, had opened a branch factory at Lucerne with a capital of 30,000,000 marks. The directors registered include Arthur Krupp and Counsellor Ernest Hauer, director of the principal Krupp factory at Essen. In compliance with the Swiss law providing that when new enterprises are established their objects must be set forth, the company declares its purpose to be the fabrication of arms, cannon, and munitions of war, the acquisition of factories, mines, and

metals, and also their sale. The Krupps purchased several houses and a large amount of ground at Lucerne. Sixty-four expert employees had arrived there by the end of the year and 300 others were expected.

**COMMERCE.** Imports and exports of merchandise and precious metals (coin and bullion) are given below in francs:

	1913	1914	1915
Imports, mdse. . .	1,919,816,280	1,478,408,489	1,680,030,259
Imports, C. & B. . .	58,054,945	32,190,066	48,702,059
Exports, mdse. . .	1,376,399,116	1,186,887,049	1,670,056,267
Exports, C. & B. . .	84,409,778	8,110,795	2,885,840

**COMMUNICATIONS.** There were, at the end of 1915, 5259.4 kilometres of railway in operation. The Swiss railways employ about 42,000 persons, of whom 35,200 work on state lines and 6800 on private railways. These figures are exclusive of the tramways or funiculars, which for the most part are common to the municipalities of the cantons. It was announced in the autumn of 1917 as possible that stage coaches might be seen again running between towns in Switzerland. Owing to the ever-decreasing amount of coal arriving from Germany, the Swiss government was forced to annul half the number of passenger trains in Switzerland, while those trains in service were not heated.

**FINANCE.** Details of the 1917 budget are given below:

Revenue	1,000 Fr.	Expenditure	1,000 Fr.
Customs, etc. . . .	64,483	Military . . . . .	37,010
Investments . . . .	9,206	Interior . . . . .	12,158
Military . . . . .	1,454	Ind. and agr. . . .	14,245
Posts and Rys. . . .	88,690	Customs, etc. . . .	9,594
Ind. and agr. . . . .	1,882	Debt charge . . . .	40,607
Justice, etc. . . . .	870	Justice, etc. . . . .	1,749
Interior, etc. . . . .	10	Administration . .	1,548
Administration . . .	112	Political . . . . .	2,071
Political . . . . .	598	Posts and Rys. . .	98,409
Miscellaneous . . . .	...	Miscellaneous . . .	...
Total . . . . .	169,872	Total . . . . .	216,042

The public debt stood, January 1, 1917, at £23,064,000; floating debt, £8,900,000.

After the hotels, the railways, particularly the mountain lines, have suffered most from the war; and as some have already ceased paying interest on their bonds, legal protection will doubtless have to be provided. The average for Swiss exchange was 0.084 per cent above par in 1913, 1.101 per cent in 1914, and 6.224 per cent in 1915. The financial report of the Swiss National Bank for 1915 compares very favorably with those for other years, the average gold and silver reserve having been \$55,829,689, as compared with \$40,968,689 in 1914 and \$37,364,800 in 1913. It was semi-officially announced, February 18, 1917, that the sixth Swiss "mobilization loan," of which 100,000,000 francs (\$20,000,000) was offered at 99, with  $4\frac{1}{2}$  per cent interest, on January 31, brought 161,000,000 francs (\$32,000,000) subscriptions, of which 139,154,600 francs (\$27,800,000) was cash, the rest older bonds for conversion. European bankers estimated that one habitant of Switzerland out of every 150 must have been a subscriber.

**GOVERNMENT.** For 1917 Edmund Schulthess was president and Felix Calonder was vice-presi-

dent of the Swiss Federal Council. On December 14 the latter was elected president for 1918, Eduard Muller succeeding him in the office of vice-president.

**HISTORY.** There were frequent rumors in January of an intention on the part of Germany to invade Switzerland. The French government on January 5 renewed the assurances that it had already given that it would respect the neutrality of Switzerland. In Switzerland itself such apprehension as was felt was directed wholly toward Germany. It was pointed out by a military authority that if the Germans wished they could find their way to Lucerne within twenty-four hours. The Federal government took measures to place Switzerland on her guard. It recalled to the colors the second division, which had been demobilized, and the president declared in an interview that if any one had the intention of violating the Swiss neutrality Switzerland would give its last man to resist. On April 14, 15,000 workmen met in Zürich and protested against the high cost of living. They demanded government monopoly in food supplies and distribution at fair prices. The demonstration became disorderly and began an attack upon two of the large hotels, but was soon dispersed.

Persistent reports were circulated in the German press in the autumn to the effect that the French meant to violate Swiss neutrality. It was said, for example, that France intended to despatch troops to the aid of Italy by the line of the Simplon tunnel. This resulted in the sending of a French message to the Swiss government to the effect that France would continue, as in the past, to respect rigidly and honorably the neutrality of Switzerland. German reports of criminal French intrigues in Switzerland continued. By the Allies they were interpreted as a sign that Germany herself intended to disregard the neutrality of Switzerland and was trying first to cast the suspicion of the same design upon the Allies.

**The Grimm-Hoffman Case.** Herr Grimm, Socialist deputy from Zürich in the National Council, who had gone to Russia in the interest of pacifist propaganda, was expelled from Russia by the order of the two ministers, Tseretelli and Skobelev. Herr Grimm was trying to negotiate a separate peace between Germany and Russia. In the course of his negotiations he spoke in the name of Herr Hoffmann, member of the Swiss Federal Council. Herr Hoffmann, as a result of the criticism following this revelation, resigned, and the president, Herr Schulthess, declared that the council was wholly ignorant of his act and disapproved it. On June 25, the Federal Assembly met and elected as a successor to Herr Hoffmann, Herr Gustav Ador, president of the International Committees of the Red Cross Society, by a vote of 168 out of 219. Herr Ador was deputy from Geneva to the Federal Council. See **SOCIALISM**.

**SYRACUSE UNIVERSITY.** A non-sectarian co-educational institution under the auspices of the Methodist Episcopal Church, located at Syracuse, N. Y. In the fall of 1917 there were 3056 students and 321 members of the faculty; about 1000 students and former students had entered the service of the government in 1917, and 17 members of the faculty were engaged in war work. Volumes in the library numbered 95,965 and there were also 40,000 pamphlets.

William L. Bray was appointed dean of the graduate school in place of William H. Metzler, resigned; Henry A. Peck was appointed dean of the college of liberal arts; and Mark E. Penney dean of the teachers' college. The late John D. Archbold pledged \$500,000 to the university. The opening of the State College of Forestry building was celebrated and a large addition to the University Hospital of Good Shepherd was erected in 1917. The university was founded in 1870. Chancellor, James Roscoe Day, LL.D., L.H.D.

**SYRIA.** A division of Asiatic Turkey, lying east of the Mediterranean Sea. It consists of the vilayets of Aleppo, Syria, and Beirut, and the mutesarrifats of Lebanon, Jerusalem, and Zor. One estimate of area is 114,530 square miles. A population estimate places the number of inhabitants at about 3,675,000, but this figure is probably excessive. See **WAR OF THE NATIONS**; and **RELIEF FOR WAR VICTIMS**.

**TAIWAN.** The official name of Formosa, used by both Japanese and Chinese. See **FORMOSA**.

**TANKS.** See **MILITARY PROGRESS**.

**TARIFF.** There was much discussion of tariffs and free trade but little legislation with respect to customs duties during the year. In May and June much attention was given by the Committee on Ways and Means of the House of Representatives to proposals to raise some \$200,000,000 of war revenue by tariff changes: this plan was later abandoned. Changes in the character of imports resulted in reductions of revenue from import duties in Great Britain, but the discussion of war aims and of world relations after the war led to extensive discussion of the pros and cons not only of national tariffs but of proposed tariff leagues. The Central European plans of Germany were known to contemplate an extension of the Zollverein principle to Austria, Hungary, and Bulgaria, and possibly Turkey. The Inter-Allied Economic Conference at Paris in June, 1916, at which the British Empire, France, Russia, Italy, Belgium, Spain, Japan, Portugal, and Serbia were represented, had declared in favor of an economic alliance among themselves to be enforced by tariff discriminations for the purpose of rendering themselves independent of enemy countries. Some aspects of the controversy resulting and the development of opinion in Great Britain are noted below.

**TARIFF COMMISSION.** By the Revenue Act of September 8, 1916, a permanent tariff commission of six members was created. The first appointments were for terms of 2, 4, 6, 8, 10, and 12 years, but thereafter all will be for terms of 12 years. Members receive \$12,000 salary. The duties of the commission are to investigate all matters relating to the administration and the fiscal and industrial effects of the customs laws of the country; to put all information in its possession at the command of the president and Congress; to investigate tariff relations between the United States and foreign countries, including the effects of commercial treaties and economic alliances and the conditions of competition in foreign trade. On March 21, 1917, President Wilson appointed the following persons to this commission: F. W. Taussig, Daniel C. Roper, David J. Lewis, William Kent, William S. Culbertson, and E. P. Costigan. Professor Taussig was later designated as chairman

and Mr. Roper, vice-chairman. The latter, however, resigned from the commission upon his appointment as commissioner of internal revenue by the president on September 26. The commission established temporary headquarters in Washington; it made W. M. Steuart chief statistician. One of the principal problems considered by the commission was the enactment of provisions to cover imports in "interim periods," or the time elapsing between the consideration of new duties and their final enactment. In this period American importers have been accustomed to bring in great quantities of goods in anticipation of the higher rates. In European countries this method of defrauding the treasury is obviated by "padlock laws" which prescribe that certain increases of duties shall go into immediate effect subject to readjustment in harmony with the rates finally established. The activities of the commission, however, in this matter were fruitless for the time being, because, although Congress gave considerable attention to changes in customs duties for many weeks, none were finally made. Nevertheless a special report, prepared by the commission, giving the examples of England, France, Italy, and other foreign countries, and showing great losses of revenue in past tariff agitations during the interim periods and urging Congress to give careful attention to this problem, laid a basis for effective action in the future.

The commission also investigated the administration of customs laws. It made a thorough historical inquiry and drew up a tentative draft of a proposed revision of the administrative code which it submitted to various departments and interested persons for criticism. It carried on an investigation as to the desirability of free ports or free zones. A free zone is defined by the commission in its *First Annual Report* as "an inclosed and guarded area where imported goods may be landed and held without customs house inspection or charges. They may there be stored, mingled, repacked, manipulated, and even manufactured. Such goods as are re-exported may be loaded and shipped without payment of duties or custom house interference." Of course, goods entering the country from the free zone must pay the established import duties. The commission made a special study of the possibilities of establishing free zones in some principal importing city of the Atlantic, the Gulf, and the Pacific Coasts.

Another important activity was the beginning of a thorough catalogue of tariff information. "somewhat in the nature of an encyclopædia." This will include a separate file for every article. The plan will also create a tariff library. The commission began preparations for a census of the American chemical industry in all its ramifications. Its first enumeration in this census was to be made early in 1918. It also began the collection of information regarding all industrial and revenue aspects of the sugar industry. Likewise it laid out an investigation of industrial disturbances due to the war; the necessary readjustments involved in peace; the stocks of goods held in European countries for export to the United States at the end of the war; and tariff changes needed to enable American manufacturers to meet after-war competition. Closely allied to this was the preparation of an extended report on all sorts of tariffs and commercial treaties. The commission said: "The

report will cover the following points: (a) interpretations of the most favored nation clause in commercial treaties; (b) an historical and critical consideration of the commercial treaties of the United States, giving particular attention to the reciprocity experiences of the United States and to the bargaining features of American tariffs; (c) the bargaining tariffs and the commercial treaty systems of the countries of continental Europe; (d) commercial relations of Canada, particularly the reciprocal relations and arrangements between the United States and Canada; (e) preferential tariffs of Australia, New Zealand, the South African Union, and India, and the proposed programmes of imperial preference within the British Empire; (f) commercial treaties and bargaining tariffs of the South American countries, with special reference to the preferential relations between the United States and Brazil; (g) situation of the Caribbean countries, with reference to treaty relations and commercial policy; (h) commercial treaty and tariff problems in the Far East." The law creating the commission especially provided that it should investigate "the Paris Economy Pact." To carry out this requirement the commission planned to send representatives abroad.

**GENERAL ASPECTS.** The fundamental importance of the tariff problem has come to be widely recognized. As shown by such writers as Walter Lippmann in *The Stakes of Diplomacy*, J. A. Hobson in *The New Protectionism*, Walter E. Weyl in *American World Policies*, and a host of others, the control of exclusive or preferential trade privileges, especially in undeveloped areas, is the chief consideration in international politics and an important cause of war. The tariff advocates laid much stress on the importance of national independence and self-sufficiency as a basis for defense in future wars; and on the advantages of trade alliances enforced by tariff preferences as the basis of military alliances. They were strongly favored by the enmities due to war, and especially by the discovery of the widespread reach of German influence and control throughout the world with respect to metals, other raw materials, manufacturing, and international trade and banking. Viewing wars as inevitable the tariff advocates held that the only safeguard against a restoration of the pre-war effects of German economic penetration lay in discriminating legislation. Free traders, on the other hand, held that the fundamentals of the theory had been unaffected or even strengthened by the war; that German trade should be met by equal skill and technique; that each nation would in the long run profit most from the broadest possible trade, including the buying and selling with present enemies; and that the future peace of the world is dependent primarily on such a growth of international trade as shall make every nation dependent to a large extent on many others for its supplies of customary necessities.

**GREAT BRITAIN.** The Paris Economic Conference above mentioned was followed by the appointment of commissions in Great Britain, France, Russia, and Italy to further the proposed action. The British commission appointed in July, 1916, was headed by Lord Balfour of Burleigh and included heads of various government departments and ten distinguished public men, of whom five were members of parliament.

This commission held many sessions, consulted various British interests, and finally issued its report in March, 1917. Its principal recommendations were: That steps be taken "to stimulate the production of foodstuffs, raw materials, and manufactured articles within the empire wherever the expansion of production is possible and economically desirable for the safety and welfare of the empire as a whole"; that as regards customs duties, "preference should be accorded to the products and manufactures of the British Overseas Dominions"; and that to achieve these ends early consideration must be given to "the desirability of establishing a wider range of customs duties which would be remitted or reduced on the products or manufactures of the empire, and which would form the basis of commercial treaties with the Allies and neutral powers." These proposals were widely regarded as foreshadowing the definite abandonment of the historic free-trade policy by Great Britain and a careful preparation of the resources of the empire for economic warfare upon the conclusion of peace. Against a restrictive policy it was argued that the idea of making England self-sufficing was chimerical; that the war had shown the free-trade policy to be the chief source of England's financial supremacy, by making her the world's banker and laying the basis of her naval power; that she thus had at her command the resources of the world on the best terms, which were wider, more varied, and more stable in supply than the resources of the empire; that the entrance of the United States with its immense market for British exports and its essential supplies of cotton and food products had altered the entire basis of after-war alliances; that the Dominions had not in general asked for preference, and for some of them it would be of doubtful expediency; and that the practical difficulties of a four-fold tariff—for empire, Allies, neutrals, and enemy countries—were insurmountable.

**TASMANIA.** A state of the Commonwealth of Australia. It consists of the island of Tasmania and various isles, most of them in Bass Strait, which separates the State from Victoria. The estimated area is 26,215 square miles, which is less than 1 per cent of the Commonwealth and about half the area of Alabama. Estimated population, March 31, 1916, 198,997, as compared with 191,211 at the 1911 census. The capital is Hobart, which, with suburbs, had an estimated population of 38,391 at the end of 1915; Launceston, 24,661.

The legislative power is exercised by a parliament of two chambers, the Legislative Council and the House of Assembly; members of the council number 18 and members of the assembly 30, and are elected for six and three years respectively. Woman suffrage was adopted in 1903. The executive authority is vested in a governor, who is appointed by the crown, and acts through a responsible ministry. The governor is Sir Francis Alexander Newdigate-Newdigate, K.C.M.G., who in 1917 succeeded Sir William Grey Ellison-Macartney. Premier and chief secretary, J. Earle. See AUSTRALIA.

**TAXATION.** The demands of war finance raised stupendous problems of taxation. The growing expenditures resulted in the finding of new sources and the raising of existing rates, as shown by the income taxes in France and the

higher rates on incomes and profits in Great Britain. In the United States entrance into the war was the signal for many striking tax proposals. Economists generally believed that a greater reliance should be placed on taxation and less on loans than in previous wars on account of the disastrous effects of loans on prices and subsequent costs of both private and public necessities. Professor O. M. W. Sprague, of Harvard, advocated that taxes be made the chief source of revenue. Many economists memorialized Congress in favor of a plan of half taxes and half loans. The plan adopted was nearer one-fifth taxes and four-fifths loans. See **FINANCIAL REVIEW; TARIFF.**

**WAR REVENUE ACT.** By all odds the most important piece of war finance legislation was the War Revenue Act of October 3. This was preceded by a long discussion in Congress of all phases of the problem and by widespread agitation of proponents of opposing views throughout the country. There were many who favored a policy of "pay as you go." They argued that in the last analysis the war must be paid for at the time it is carried on; that the popular supposition that the cost can be transferred to future generations by means of bond issues is a fiction, because as a matter of fact bonds only serve as a means of distributing the burden among different elements in the community. The real cost of the war, so it was argued, is, in addition to human life and suffering, the material goods consumed in its prosecution. When the war is over this consumption ceases and the actual costs of the war consequently also cease. The extreme advocates of this doctrine therefore advanced a proposal to conscript wealth, declaring that if we were to conscript man power we should conscript material resources. The opposite extreme was represented by those who favored extensive bond issues with only slight reliance upon taxation. They made much of the effect of taxation in "frightening capital" with a consequent undue interference with business and the abnormal disturbance of the entire economic basis of the national life. The actual measure was a compromise between these extremes and various other special views.

As enacted the law was expected to provide more than \$2,500,000,000 for the year 1917. The act was divided into 13 parts dealing with the following subjects: (1) income; (2) excess profits; (3) beverages; (4) cigars, tobacco, and tobacco manufactures; (5) public utilities and insurance; (6) excises; (7) admission and dues; (8) stamp taxes; (9) estate taxes; (10) administrative provisions; (11) postal rates; (12) income tax amendments; and (13) general provisions. It was estimated that the excess profits tax would produce \$1,060,000,000 of revenue, and that this income tax, which was in addition to that of September, 1916, would produce \$842,000,000. The excess profits tax of this act wholly superseded the excess profits tax of March 3, 1917.

**INCOME TAX.** The war income tax of October, 1917, levied assessments in addition to those levied by the act of September 8, 1916. Both taxes applied to the income from all sources of every American citizen or resident. These laws levied a normal tax and a "super-tax" or "additional tax." The basis of levy for the normal tax is the difference between the net income

of the individual and the personal exemption plus the sum of dividends which have been taxed at their source. The exemption under the act of 1916 is \$3000 for single persons and \$4000 for married persons living together, or heads of families. Section 12 of the act of 1917 amended the 1916 act by allowing \$200 additional exemption for each dependent child under 18 or other dependents physically or mentally deficient. Exemptions under the act of October, 1917, are only \$1000 for single persons and \$2000 for married persons with the addition of \$200 for each dependent.

The basis of levy for the super-tax or additional tax is under the act of 1916 all net income above \$20,000 and under the act of 1917 all net income above \$5000. All provisions apply to the calendar year. The tax for 1917 may be paid any time after assessment and must be paid not later than June 15, 1918. Payment may be made in installments. The following table indicates "additional" or "super taxes" under both acts and their total. This does not include the excess profits or "occupational" tax of 8 per cent on individuals with incomes over \$6000; nor the normal taxes of 2 per cent.

Additional Taxes on Net Incomes		Per Cent Under Act of 1916	Per Cent Under Act of 1917	Total Per Cent of Additional Tax
Over	And not Over			
\$5,000	\$7,500	none	1	1
7,500	10,000	none	2	2
10,000	12,500	none	3	3
12,500	15,000	none	4	4
15,000	20,000	none	5	5
20,000	40,000	1	7	8
40,000	60,000	2	10	12
60,000	80,000	3	14	17
80,000	100,000	4	18	22
100,000	150,000	5	22	27
150,000	200,000	6	25	31
200,000	250,000	7	30	37
250,000	300,000	8	34	42
300,000	500,000	9	37	46
500,000	750,000	10	40	50
750,000	1,000,000	10	45	55
1,000,000	1,500,000	11	50	61

Thus, single men will pay 2 per cent on all incomes above \$3000 under the act of 1916; and 2 per cent on all incomes above \$1000 under the act of 1917; besides the additional taxes on incomes above \$5000 as indicated in the foregoing table. A married man would pay 2 per cent on his income above \$3000 less \$200 for each legal dependent under the act of 1916; and 2 per cent on his income above \$2000 less the same deductions for dependents under the act of 1917; besides the additional taxes on incomes above \$5000 as indicated in the preceding table. Total tax on incomes above \$5000 may be found by adding 4 per cent for the normal tax to the percentages given in the last column of the above table. While the number of returns in 1917 for the taxation of 1916 personal incomes was only 780,000 the number in 1918 was expected to exceed 6,250,000, and the yield was estimated at over \$1,000,000,000.

The summary of the returns of the individual income tax for fiscal year ending June 30, 1917, issued on December 3, 1917, showed that income taxes had been paid by 429,401 persons in that

year, and that the total yield was \$180,108,340.10. Whereas the returns for 1915 had indicated that there were 14,771 millionaires in the United States, those for 1916 showed 22,696 millionaires. These figures are based on the supposition that persons with incomes of at least \$40,000 belong to the millionaire class. The report showed that there were 206 persons in 1916 acknowledging incomes of at least \$1,000,000, while 10 acknowledged incomes of \$5,000,000 or more. There were 375,626 persons paying the tax on incomes between \$3000 and \$20,000; 31,079 persons paying on incomes between \$20,000 and \$40,000; 21,869 persons paying on incomes between \$40,000 and \$400,000; 621 persons paying on incomes between \$400,000 and \$1,000,000; 139 paying on incomes of \$1,000,000 to \$2,000,000; 48 paying on incomes of \$2,000,000 to \$4,000,000; and 9 paying on incomes of \$4,000,000 to \$5,000,000. The following States were those paying total individual income taxes in excess of \$2,500,000, together with the amounts paid by them respectively: New York, \$81,495,783; Pennsylvania, \$17,860,341; Illinois, \$11,739,952; Massachusetts, \$10,959,847; Ohio, \$8,066,088; New Jersey, \$5,621,910; Oklahoma, \$4,428,842; California, \$3,870,314; Delaware, \$3,666,351; Michigan, \$3,627,884; Connecticut, \$3,050,912; Texas, \$2,781,779; and Missouri, \$2,516,416.

The corporation income tax for 1916 (fiscal year 1917) yielded a total of \$179,552,887. States paying the largest amounts were: New York, \$48,566,000; Pennsylvania, \$24,238,000; Illinois, \$14,359,000; Ohio, \$12,873,000; Massachusetts, \$9,320,000; Michigan, \$6,566,000; California, \$6,147,000; and New Jersey, \$5,250,000.

**WAR EXCESS PROFITS TAX.** For this tax the first taxable year was that ending December 31, 1917, except that where a corporation had its own fiscal year the first taxable year should be the fiscal year ending during the calendar year 1917. The term "pre-war period" as used in the act means the calendar years 1911 to 1913 inclusive. The act specified the manner of determining the average annual profits in the pre-war period and indicated progressive rates of taxation for increasing amounts of war profits over and above the normal profits of the pre-war period. Thus where the excess profits due to the war were not over 15 per cent of the invested capital the tax was 20 per cent of such profits; where profits ranged from 15 per cent to 20 per cent on the capital the tax was 25 per cent; on profits of 20 to 25 per cent the tax was 35 per cent; on profits of 25 per cent to 33 per cent the tax was 45 per cent; and on profits above 33 per cent the tax was 60 per cent.

One of the sections inserted at the last moment and placing a tax on a trade or business with no invested capital or only a nominal capital aroused widespread resentment among professional men. It was found that this section (sec. 209) levied a tax of 8 per cent on the net income in excess of \$3000 for a domestic corporation and in excess of \$6000 for a domestic partnership or a citizen or resident of the United States, except members of Congress and officers of the government. It was pointed out that a tax of 8 per cent on the incomes of professional men, in addition to other taxes, placed an undue burden upon earned income. Consequently upon the convening of Con-

gress in December steps were taken for the repeal of this provision. Opinion differed as to whether the section should be entirely repealed or extended to members of Congress and officers of the government previously exempted. After hot discussion the House of Representatives passed a bill with the latter intent.

**OTHER SECTIONS.** The war tax on beverages included \$1.10 per gallon on spirits in bond and \$2.10 per gallon on spirits withdrawn for beverage purposes; the doubling of the taxes on beer, wines, and brandy; and a graduated tax on syrup and extracts used in the manufacture of soft drinks. The new taxes on tobacco and its manufactures included a tax of 25 cents per thousand on cigars weighing less than 3 pounds per thousand; of \$1 per thousand on cigars weighing less than 3 pounds per thousand and retailing at from 4 to 7 cents each, with graduated increases up to \$7 per thousand on cigars retailing at over 20 cents each; taxes of 80 cents or \$1.20 per thousand on cigarettes according as they weigh less or more than 3 pounds per thousand; and 5 cents per pound on tobacco and snuff. The public utilities and insurance taxes included levies on receipts from freight transportation, from express and passenger services, from the sale of seats, berths, and staterooms on parlor cars or on vessels, charges for telephone, telegraph, and radio messages; and a tax of 8 cents on each \$100 of life insurance (except that industrial policies of less than \$500 pay 40 per cent of the first weekly premium) and 1 cent on each dollar of premium paid for marine inland and casualty insurance.

The war excise taxes levied 3 per cent on the selling price of automobiles, motorcycles, musical instruments, talking machines, jewelry, cameras, and sporting goods; 2 per cent on perfumes, cosmetics, proprietary medicines, chewing gum, and similar articles; one-fourth to one-half per cent per linear foot on motion picture films; graduated taxes upon watercraft; and half of the foregoing rates on retailers' stocks already on hand. Under title 7 a tax of 1 cent for each 10 cents or fraction thereof was levied on admission fees, with various modifications and exemptions; and 10 per cent on the dues and membership fees of social, athletic, and sporting clubs, when in excess of \$12 a year. Under the stamp taxes various levies were made upon bonds, stock certificates, and their sales or transfers, sale of produce on exchange, drafts, or checks payable, deeds and papers of conveyance, custom-house entries, passage tickets to ports and places not in the United States, Canada, or Mexico, power of attorney, playing cards, and parcel post packages.

The Federal inheritance tax had been revived by the act of September 8, 1916; the rates were then increased 50 per cent by the act of March 3. The rates fixed in the act of October 3 ranged from 2 per cent on estates below \$50,000 to 25 per cent on estates of \$10,000,000 or more. The other classes were as follows: \$50,000 to \$150,000, 4 per cent; \$150,000 to \$250,000, 6 per cent; \$250,000 to \$450,000, 8 per cent; \$450,000 to \$1,000,000, 10 per cent; \$1,000,000 to \$2,000,000, 12 per cent; \$2,000,000 to \$3,000,000, 14 per cent; \$3,000,000 to \$4,000,000, 16 per cent; \$4,000,000 to \$5,000,000, 18 per cent; \$5,000,000 to \$8,000,000, 20 per cent; and \$8,000,000 to \$10,000,000, 22 per cent.

The principal increase in postal rates was that of 3 cents per ounce on letters, except drop letters (2c), and of 2 cents each for post cards. There were in addition various increases in parcel post rates and in the rates applicable to periodicals. The latter rates were graded according to the proportion of space devoted to advertising; and annual increases in such rates were provided for each year up to and including 1921.

**FRANCE.** An income tax law passed in July, 1914, affecting incomes above 5000 francs became operative in 1916. The rate was 2 per cent. Afterwards the exemption limit was lowered to 3000 francs (\$600) and the rates graduated from 2 to a maximum of 10 per cent. Previous to this charge declarations were received from 285,000 persons with total incomes of 4,000,000,000 francs, but 180,000 persons claimed total exemption. After the change declarations were received from 560,000 persons with total incomes of 6,000,000,000 francs while exemptions were claimed by only 20,000. Contributors failing to make a return, and there were many such, had their tax fixed by the revenue officials on the basis of annual house rent.

This system was greatly modified for the fiscal year 1918. The new law requires a declaration of all income during 1917 from every tax payer; various exemptions to heads of families are allowed; and the maximum rate is advanced to 12½ per cent. There is a rebate of 2000 francs for a wife and a total of 2000 additional francs for children, besides the general exemption of 3000 francs. Distinction is made between earned incomes which are taxed at 3.75 per cent, revenue from foreign investments taxed at 6 per cent, and revenue from home investments taxed at 5 per cent.

**GREAT BRITAIN.** A thorough study of British finances by George Foster Peabody as summarized in *The Annalist* showed that total expenditures of the Government between August 1, 1914, and April 1, 1917, the end of the fiscal year, were \$21,278,000,000. Of this sum \$5,682,000,000 had been raised by taxation, an amount exceeding the normal peace revenues by \$2,575,000,000. The normal peace expenditures for the same period would have been \$2,760,000,000, so that the war expenses were \$18,625,000,000. Of this latter sum \$4,800,000,000 had been advanced to Allies and colonies. The ratio of the total sum raised by taxation to the total expenditures was \$1 of taxes to \$3.95 spent; or excluding the loans to Allies a ratio of \$1 of taxes to \$2.56 spent. This high proportion of taxes was deemed distinctly creditable to British financial methods. These figures indicated that the annual expenditures for war purposes had been about \$7,000,000,000 a year. For the fiscal year ending March 31, 1918, the total revenue from taxes including the advance on war profits from 60 to 80 per cent and additional duties on tobacco was estimated at \$3,190,000,000.

For the fiscal year 1917-18 Chancellor of the Exchequer McKenna asked for a total of about \$11,000,000,000, of which two billions were for advances to colonies and Allies. At the same time the total income of Great Britain was estimated at about \$12,500,000,000. The total revenues from all taxes in 1916-17 had been about \$2,800,000,000; it was expected that this could be increased in 1917-18 to somewhat over three

billions. The principal sources were as follows: income tax, \$1,100,000,000; excess profits duty, \$1,000,000,000; estate duties, \$150,000,000; customs and excises about \$550,000,000. The income tax rates were graded from 11½ per cent on earned incomes under \$500 to 42½ per cent on incomes in excess of \$50,000. The excess profits taxes in 1916-17 graded up to 60 per cent but were increased in 1917 so that the maximum rate was 80 per cent.

E. Hannan, *Property Exempt from Taxation in the Forty-eight States*.

**TAYLOR, SIR WILLIAM.** A British army surgeon, died at Windsor, England, in April, 1917. He was born at Moorfield, Ayrshire, in 1843, and was educated at Glasgow University. Joining the army medical staff in 1864, he served in different parts of the empire during important campaigns. While in Canada as a young man he took part in the operations against the Fenian raiders on the Vermont border and was awarded a medal. Many years of his life were spent in India (1870-80, 1882-93, and 1898-1901). During the first of these periods he participated in the Jowaki expedition and earned another medal, in the second period he served on the staff of the commander-in-chief during the Burman campaign, again distinguishing himself, and finally he was principal military officer to the British forces in India. This last post or its counterpart he had already held in the Ashanti expedition of 1895-96, when he won the Queen's star and was specially promoted to surgeon-general, and in Kitchener's march to Khartum in 1898. Taylor was present at the battle of Omdurman and received as the reward for his services the C.B., second-class Medjidie, and English and Egyptian medals. During the Chino-Japanese War he had been sent to act as military-medical attaché to the Japanese army. He retired in 1904 after three years as director of the army medical service, and, after becoming honorary physician to the king and receiving the K.C.B., he was also created a Knight of Grace of the Order of St. John of Jerusalem in England, and Glasgow honored him with an LL.D.

**TEACHERS IN PUBLIC SCHOOLS.** See EDUCATION IN THE UNITED STATES.

**TEACHERS' INSURANCE AND ANNUITY ASSOCIATION.** See UNIVERSITIES AND COLLEGES.

**TELEPHONY.** The year 1917 brought out comparatively few improvements in telephone apparatus; there were minor changes introduced in switchboard devices and methods of wiring for the purpose of facilitating connections between subscribers and making it possible for an operator to supervise her lines more readily. Semi-automatic systems held their own in competition with the long-established manual systems. The predominating influence in the telephone industry was, of course, that of the war. In addition to an enormously increased demand for service it became evident as soon

as the United States entered the war that it would be almost impossible for the manufacturing companies to secure material needed to supply the normal growth of their lines and exchanges. In addition to this there was a very great change in the number and character of employees owing to the large number who voluntarily enlisted or were drafted. At the same time the personnel of the exchange operators was also greatly affected, and judging from the public appeals issued by the various operating companies of the Bell system it was increasingly difficult towards the end of the year to secure a sufficient number of operators to take the places of the women who had left.

Mr. J. J. Carty, chief engineer of the New York Telephone Company, was made major in the Officers' Reserve Corps, U. S. Army, and at the close of the year was with the American armies in France in charge of telephonic and telegraphic communication.

In the annual report of Mr. Burleson, the postmaster general of the United States, it was recommended, as in the previous year, that the government take over all telephone and telegraph lines and operate them. This recommendation met with no general public support and at the close of the year there seemed to be no marked demand for any such action, as both these systems of communication were rendering unusually efficient service not only to the public at large, but particularly to the various branches of government activity.

**TELESCOPES.** See **ASTRONOMY.**

**TENNESSEE. POPULATION.** The estimated population of the State on July 1, 1917, was 2,304,629. The population in 1910 was 2,184,789.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. Bu.	Value
Corn ....	1917	3,900,000	111,150,000	\$133,380,000
	1916	3,000,000	78,000,000	73,320,000
Wheat ...	1917	522,000	4,830,000	10,723,000
	1916	880,000	7,885,000	13,236,000
Oats ....	1917	800,000	7,850,000	6,100,000
	1916	260,000	5,460,000	3,385,000
Potatoes ..	1917	52,000	4,888,000	6,159,000
	1916	36,000	2,952,000	4,398,000
Hay ....	1917	892,000	a 1,142,000	22,041,000
	1916	1,050,000	1,449,000	21,735,000
Tobacco ..	1917	101,000	b 18,810,000	13,908,000
	1916	102,200	18,760,000	8,258,000
Cotton ...	1917	857,000	c 208,000	28,119,000
	1916	887,000	382,000	37,288,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The production of coal in 1916 was 6,137,440 tons, an increase compared with 1915 of 407,088 tons, or 7 per cent. The most important influence causing this increase was the demand for coke and coal by the iron industry. Railroad consumption of coal was greater than in 1915, and all the industries of the State and in nearby States, which depend on this coal, were in full operation, and using a maximum quantity of fuel. During the first half of the year the car supply was ample, and operators were able to furnish all the coal required. During this period there was a surplus of labor. In the last half of the year, however, there was a shortage of cars and of labor.

The production of iron ore in 1916 was 455,834 gross tons, compared with 284,185 tons in 1915. The ore shipped from the mines in the State in 1916 was valued at \$736,397, compared with a value in 1915 of \$408,204.

The mined production of gold, silver, copper, lead, and zinc in Tennessee in 1916 was valued at \$10,764,189, compared with \$7,298,406 in 1915, an increase of \$3,465,783. The copper output of the State in 1916 was 14,679,794 pounds, valued at \$3,611,229, and the zinc was 52,855,480 pounds, valued at \$7,082,634.

**TRANSPORTATION.** The total mileage of the State in 1916 was 4102. The railways having the longest mileage were: Southern Railroad, 891; Louisville and Nashville, 862; Nashville, Chattanooga, and St. Louis, 899; Illinois Central, 348.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include three hospitals for the insane, the Tennessee Deaf and Dumb Schools, the Tennessee School for the Blind, Confederate Soldiers' Home, Tennessee Industrial School, Tennessee Reformatory for Boys, The Blind Girls' School, and the State Penitentiary.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below:

Laws relating to prisoners and the punishment for crime were amended in important details. The contract system of letting out prison labor to private contractors was prohibited. The question of whether there shall be a constitutional convention is to be submitted to the voters at the next general election. A measure providing for the budget system for preparing and enacting annual legislation was created. A compulsory system of party primary elections was provided for, and provision was made for the voting of citizens absent from the State in the national service. A general prohibition law was passed. An act was passed prohibiting the limiting of output of coal for the purpose of raising the price; and measures were enacted for the inspection and regulation of the sale of gasoline and other products. The insurance laws were amended in important particulars. The laws relating to health were also amended. Governor Rye, on February 2, signed the prohibition bill passed by the legislature forbidding the importation of liquor into the State.

**STATE OFFICERS.** Governor, Thomas C. Rye; Secretary of State, J. B. Stevens; Treasurer, Porter Dunlap; Auditor, Hayes Flowers; Commissioner of Agriculture, H. K. Bryson; Superintendent of Education, S. W. Sherrill; Comptroller, John B. Thomason; Adjutant-General, A. G. Buckner; Attorney-General, Frank M. Thompson; Commissioner of Insurance, L. K. Arrington—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, M. M. Neil; Justices, S. C. Williams, D. Lansden, Arthur S. Buchanan, and Grafton Green; Clerk, Preston Vaughn.

**TENNESSEE, UNIVERSITY OF.** A non-sectarian co-educational institution at Knoxville, Tenn. In the fall of 1917 there were 779 students and 243 members of the faculty. Volumes in the library numbered 42,600. Productive funds in 1917 amounted to \$425,000 and the income therefrom to \$26,529. The university was founded in 1794. President, Brown Ayres, LL.D., D.C.L.

**TENNIS.** All championship tournaments in tennis were cancelled in 1917 except those in which juniors and boys competed. This was in accordance with the decision reached by the United States Lawn Tennis Association when war was declared and the call to the colors had been answered by a vast majority of the star players of the country. Under the conditions the success the sport attained during the season is especially noteworthy. The so-called "patriotic" tournaments held not only preserved the prestige tennis had secured but the receipts from them enabled the association to finance and man two ambulance units which were presented to the government.

Robert Lindley Murray, of California, won the highest honors of the year by capturing the singles in the patriotic tournament, held at the West Side Club, Forest Hills, L. I. Murray defeated in turn William T. Tilden, 2d, Craig Biddle, John R. Strachan, and Nathaniel W. Niles. Richard Norris Williams, 2d, the title holder, was eliminated by Niles in the semi-final round.

The women's patriotic singles were won by Miss Molla Bjurstedt, the champion. Miss Bjurstedt and Miss Eleanora R. Sears were the victors in the women's doubles and Miss Bjurstedt and Irving C. Wright in the mixed doubles. The national junior title went to Charles S. Garland, of Pittsburgh, and the boys' crown was secured by Vincent Richards, of Yonkers, N. Y.

A summary of the principal tournaments held in the United States follows:

National Patriotic Singles, Forest Hills—Final round, Robert L. Murray defeated Nathaniel W. Niles, 5-7, 8-6, 6-3, 6-3.

National Patriotic Doubles—Longwood Cricket Club, Boston—Final round, Fred B. Alexander and Harold A. Throckmorton defeated Harry C. Johnson and Irving C. Wright, 11-9, 6-4, 6-4.

Women's National Patriotic, Philadelphia Cricket Club, Philadelphia—Singles, final round, Miss Molla Bjurstedt defeated Miss Marion Vanderhoef, 4-6, 6-0, 6-0; doubles, final round, Miss Bjurstedt and Miss Eleanora Sears defeated Mrs. Robert Le Roy and Miss Phyllis Walsh, 6-2, 6-4; mixed doubles, final round, Miss Bjurstedt and Irving C. Wright defeated Miss Florence A. Ballin and W. T. Tilden, Jr., 10-12, 6-1, 6-3.

Clay Court Patriotic, Cincinnati, Ohio—Singles, final round, Samuel T. Hardy defeated Charles S. Garland, 3-6, 6-1, 1-6, 6-3, 6-3; doubles, final round, Hardy and Garland defeated H. T. Emerson and W. H. Hopple, 6-4, 6-2, 6-3; women's singles, final round, Miss Ruth Sanders defeated Mrs. Walter Ellis, 6-1, 6-3; women's doubles, final round, Miss Sanders and Mrs. Charles Gregg defeated Mrs. Walter Ellis and Miss Adele Levy, 6-4, 6-2; mixed doubles, final round, Miss Sanders and Howard Cordes defeated Miss Leonora Hofer and Charles S. Garland, 6-1, 6-2.

Junior and Boys' Championships, West Side Tennis Club, Forest Hills, L. I.—Junior singles, final round, Charles S. Garland defeated Fritz Bastian, 6-2, 6-1, 2-6, 6-3; boys, final round, Vincent Richards defeated J. D. E. Jones, 6-0, 6-3, 6-1.

National Indoor, Seventh Regiment Armory, New York City—Singles, final round, S. H. Voshell defeated C. B. Herd, 7-5, 6-3, 6-3; dou-

bles, final round, Dr. William Rosenbaum and Fred B. Alexander defeated A. H. Man, Jr., and C. B. Herd, 6-4, 6-4, 2-6, 7-9, 6-4.

National Women's Indoor, Seventh Regiment Armory, New York City—Singles, final round, Miss Marie Wagner defeated Miss Eleanor Goss, 6-3, 6-1; doubles, final round, Miss Wagner and Miss M. H. Taylor defeated Mrs. Anderson and Miss Howe, 6-4, 6-4.

Junior National Indoor, Seventh Regiment Armory, New York City—Singles, final round, E. H. Binzen defeated H. B. O'Boyle, 6-1, 7-5, 6-3; doubles, final round, Willard Botsford and R. B. Haines defeated I. L. Hopkins and F. N. Hopkins, 6-3, 6-2, 5-7, 6-3.

Western Patriotic, Chicago, Ill.—Men's singles, final round, Walter T. Hayes defeated Samuel T. Hardy, 6-3, 6-0, 6-1; men's doubles, final round, Garland and Hardy defeated Hayes and Burdick, 6-2, 4-6, 7-5, 3-6, 6-3; women's singles, final round, Miss Carrie B. Neely defeated Miss Mary K. Voorhees, 6-0, 6-3; women's doubles, final round, Miss Neely and Miss Seavey defeated Miss Steever and Miss Voorhees 15-13, 6-3.

Pacific Coast, Oakland, California—Singles, final round, William M. Johnston defeated John R. Strachan, 6-3, 0-6, 6-1, 4-6, 6-2; women's singles, final round, Mrs. G. W. Wightman defeated Miss Helen Baker, 6-8, 6-0, 6-0.

Women's Metropolitan Patriotic, West Side Tennis Club, Forest Hills, L. I.—Singles, final round, Miss Molla Bjurstedt defeated Mrs. C. V. Hitchens, 6-3, 6-1; doubles, final round, Miss Molla Bjurstedt and Miss Marie Wagner defeated Miss Helen Pollak and Miss Helen Bernhardt, 6-1, 7-5; mixed doubles, final round, Miss Bjurstedt and A. H. Man, Jr., defeated Miss Florence A. Ballin and Fred B. Alexander, 6-4, 8-6.

**TERRESTRIAL MAGNETISM.** During the year 1917, the United States Coast and Geodetic Survey published a fifty-one-page pamphlet, containing the results of the magnetic observations made by the survey at 352 stations and in 33 States and Territories. These were tabulated and gave the declination, dip, and horizontal intensity for a number of stations whose geographic position was determined, as well as a separate description of each station. These values obtained in 1916 were compared with earlier values at the same stations, or those in the vicinity of older stations, so that the information was of special value to surveyors and engineers, engaged in reproducing on the ground the lines of old surveys made with the magnetic compass. In addition, various auxiliary stations were occupied, and the result was the accumulation of valuable data.

**TEXAS. POPULATION.** The population of the State in 1910 was 3,896,542 and on July 1, 1917, it was estimated to be 4,515,423.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1917	7,075,000	77,825,000	\$129,268,000
	1916	6,800,000	129,200,000	134,368,000
Wheat	1917	1,350,000	16,200,000	34,020,000
	1916	1,200,000	13,200,000	22,836,000
Oats	1917	1,425,000	37,050,000	30,381,000
	1916	1,500,000	42,750,000	26,078,000
Rice	1917	230,000	8,210,000	12,420,000
	1916	235,000	10,575,000	9,094,000

	Acreage	Prod. Bu.	Value
Potatoes ..1917	46,000	2,760,000	\$5,796,000
1916	40,000	2,000,000	3,800,000
Hay ....1917	450,000	a 450,000	9,000,000
1916	480,000	578,000	6,048,000
Tobacco ..1917	200,000	b 184,000	70,000
1916	200,000	140,000	28,000
Cotton ...1917	11,052,000	c 3,115,000	415,852,000
1916	11,400,000	3,728,000	381,398,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The coal production of the State in 1916 was 1,987,503 net tons, valued at \$3,092,663, a decrease of 101,405 tons from 1915. The decrease was mainly in the bituminous districts. A strike that closed many of the mines during September was the chief cause of the decrease, as the demand for coal by railroads and industries was good, and the supply of cars and labor was abundant during the year.

The production of petroleum in Texas in 1916 surpassed all previous records, and the State continued to hold third rank among the oil-producing States. The total production was 27,644,605 barrels, valued at \$25,760,335 in 1916, compared with 24,942,701 barrels in 1915, valued at \$13,026,925, an increase of 11 per cent in quantity and 98 per cent in value.

The output of metals mined in 1917 amounted to \$1000 in gold, 579,000 ounces of silver, 160,000 pounds of lead, and 20,000 pounds of copper, compared with \$414 in gold, 653,455 ounces of silver, 49,927 pounds of lead, and 99,569 pounds of copper, and 232,388 pounds of zinc in 1916.

The output of metal mined in 1916 had a total value of \$489,466 compared with \$365,480 in 1915. Silver is the principal metal produced.

**TRANSPORTATION.** The railroad mileage of the State on June 30, 1916, was 15,655 miles of main track and branches, with 4208 miles of yard tracks and sidings.

**FINANCE.** The report of the State treasurer for the fiscal year of 1916, the latest for which statistics are available, showed a balance at the beginning of the year of \$3,512,991. The receipts of the year amounted to \$15,856,850, and the disbursements amounted to \$16,324,550, leaving a balance of \$3,045,291 in the treasury on April 31, 1917.

**EDUCATION.** The total enrollment of white pupils in the elementary schools of the State in 1916, the latest year for which data are available, was 732,744. In the high school grades there were enrolled 88,708, making a total enrollment of 821,432. The number of teachers employed in the schools for white children numbered 23,578, of which 17,019 were female and 6559 male. In the school for colored children there were employed 3780 teachers of whom 2562 were female and 1215 male. The average annual salary paid to male teachers in the elementary white schools was \$491.55, and to female \$405.35. In the colored schools the average salary of males was \$395.67 and of females \$340.89.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the State penitentiary at Huntsville, State penitentiary at Ruak, Insane Hospitals at Austin, Terrel, and San Antonio, State Orphans' Home at Corsicana, State Epileptic Colony at Abilene, Deaf and Dumb Institute at Austin, Confederate Sol-

diers' Home, Confederate Women's Home, and the Deaf, Dumb, and Blind Institute for Colored Youths at Austin, State Juvenile Training School at Gatesville, State Tuberculosis Sanatorium at Carlsbad, and the Girls' Training School at Gainesville.

**POLITICS AND GOVERNMENT.** A number of negro soldiers of the Twenty-fourth Infantry stationed at Houston started a race riot in that city. The trouble began with a conflict with the local police, who had arrested some men of the negro regiment with what was declared unnecessary violence. In retaliation for this, the negroes resolved to make a raid on the city and shoot some members of the police force. A number of them started out from their camp and killed some police and wounded several others. A number of the bystanders were also shot. Before the riot was finally quelled, seventeen were killed and a number seriously wounded. Among those dead was Captain J. W. Mattes of the Second Illinois Field Artillery, who, when he attempted to restrain the soldiers, was killed by them. The city was placed under martial law, and order was quickly restored. As a result of the affair, there was a demand by the people of the State for the removal of all negro regiments excepting those native to the State. After court-martial, thirteen soldiers were hanged on December 11 for complicity in the riots. Forty-one others were sentenced to life imprisonment and four to prison for short terms.

Governor Ferguson, in June, vetoed the appropriations for the State university. This action caused great dissatisfaction. The attorney-general of the State prepared an opinion, in which he pointed out that the veto was invalid because the governor indicated by special mark the items of the bill of which he disapproved. This, in the opinion of the attorney-general, left the grand total of the appropriation unaffected, and made it lawful for the State regents to use the entire available fund for the university for its support. The governor's action resulted from a controversy between him and President Vinson, of the university, over the refusal of the latter to dismiss certain members of the faculty to whom the governor objected.

In the first week of August impeachment charges were filed against Governor Ferguson for alleged misappropriation of public funds. The charges were made by the Speaker of the House of Representatives, who issued a call for a special session of the legislature to consider them. The legislature had already been summoned for the purpose of repassing the appropriation bill for the support of the university which the governor had vetoed a few weeks before. One of the acts in the indictment against the governor was that he attempted to defeat the constitutional requirements for the State support of the university, and only re-submitted the appropriation bill, which made the existence of the university possible, after indictment charges had been instituted against him. He was also charged with failure to pay money into the State treasury as required by law, and with keeping it for his own use; with placing public funds in his own bank without interest; and attempting to bribe members of the State Board of Regents and the Speaker of the House in order to influence their po-

litical actions. The governor denied all the charges brought against him, and declared that many of the acts for which he had been criticized had been committed as a matter of course by previous governors, whose conduct had never been questioned.

On August 23 the House of Representatives adopted, by a vote of 82 to 51, the recommendation of a committee appointed to consider the matter of impeachment charges. A commission of nine was appointed to draw up formal articles of impeachment for the approval of the House. On the next day twenty-one articles were filed in the Senate by the committee. With this action W. P. Hobby, lieutenant-governor, became governor of the State. The principal charges made in the indictment were those noted above.

The trial for impeachment was begun on September 22 by the Senate. After hearing the evidence for three days the Senate formally pronounced judgment, and declared the governor removed from office, and disqualified him from further holding any office in the State. Governor Ferguson had anticipated this action, and resigned a few hours before the judgment was pronounced. He announced, however, that he would be a candidate for governor at some future election. W. P. Hobby succeeded him as governor.

Of the twenty-one charges brought against the governor, ten were sustained. Nearly all these related to the misuse of trust funds and public money in favor of banks in which the governor had personal interest. He was, however, convicted of various unlawful attempts to coerce the Board of Regents of the University of Texas.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below:

Laws relating to safety and sanitation were amended. Adequate fire escapes are required on factories and semi-public buildings. The workman's compensation law was amended to include injury without the State. Several amendments were made to the laws affecting public utilities. Pipe lines for the transportation of oil and gas are declared common carriers and are placed under the control of the railroad commission. An amendment to the constitution was proposed which declares that the conservation and preservation of all the natural resources of the State are public rights and duties, and provides for the creation of conservation districts. A mother's pension act was passed.

**STATE OFFICERS.** Governor, W. P. Hobby; Lieutenant-Governor, W. L. Johnson; Secretary of State, Geo. F. Howard; Adjutant-General, James A. Harley; Attorney-General, Benj. F. Looney; State Treasurer, J. M. Edwards; Comptroller, H. B. Terrell; Superintendent of Public Instruction, W. F. Doughty; Commissioner of Agriculture, Fred W. Davis; Commissioner of Insurance, \_\_\_\_\_ all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, Nelson Phillips; Associate Justices, W. E. Hawkins and James E. Yantis; Clerk, F. T. Connerly.

**TEXAS, UNIVERSITY OF.** A co-educational State institution at Austin, Tex. In the fall of 1917 there were 1780 students and 176 members of the faculty. Volumes in the library

numbered 130,000. J. Battle, professor of Greek for twenty-four years, resigned to become professor of Greek at the University of Cincinnati. Productive funds in 1917 amounted to \$2,050,000 and the income therefrom to about \$200,000. The university was founded in 1831. President, Robert Ernest Vinson, LL.D. See TEXAS for account of controversy of members of the faculty of the university and the governor of the State.

**TEXTILE INDUSTRY.** In the United States in 1917, a leading question in the textile industry was the manufacture of various materials needed for the army and navy, not only for uniforms but for such purposes as accoutrements, tentage, aeroplane cloth, gas masks, and other purposes. Various new uses were found for old fabric while special fabrics such as shell cloths made of silk noils were also being constructed. Mercerized cotton was being made for aeroplane wings and narrow cotton webbings for leather strappings were also new features. Cotton webbing to a large degree was replacing leather for various military accoutrements not only on account of the high prices of leather but for its greater serviceability and lighter weight. Towards the end of the year, plans were being made for increased production of cloth for aeroplanes, balloons, and gas masks, and for this purpose the fine count cotton spindles and looms would be utilized. Another new form of textile activity was a series of open-work fabrics which were being used for camouflage effects following the successful utilization of such material by the English and the French. Many hundred thousand yards of this material were contracted for in the United States and would be placed in connection with various screenings which the camouflage troops would construct. The reason for the decision to use cotton for aeroplane wings for the American machines was the fact that the Irish and Scotch linen manufacturers were unable to produce any more linen fabrics, the output of which was being utilized as fast as made by the Allies for the wings of their larger machines for which a special strength was required which linen was able to afford better than other materials. Nearly two-thirds of the production of the available linen looms of Belfast, Ireland, was of this material.

The cotton fabric that was being made in the United States was of two varieties. One, from combed Sea Island mercerized yarn weighing 4 oz. to the square yard and having 68 threads per inch in both warp and filling, showed a strength test of not less than 73 lbs. in both warp and filling on a sample 12 in. long and 1¼ in. wide. Another was of combed Sea Island mercerized yarn but heavier and stronger. Each aeroplane required 170 yds. of 40-in. cloth or 189 sq. yds. per plane, and to provide the cloth for 26,000 planes the contemplated production for the United States would involve the output of over 150,000 spindles. The new American mercerized cotton fabric seemed to meet all tests and with its subsequent necessary treatment after being stretched, it was thought, would answer every requirement. New balloon fabrics composed of a greater or less amount of silk were also being manufactured.

**UNIFORM CLOTHS.** The principal activity in the textile industry during the year centred

in the woolen fabrics for the uniforms as purchased by the Quartermaster's Department through the Committee of Supplies of the Council of National Defense and the Bureau of Supplies and Accounts. Four fabrics, namely,  $8\frac{1}{2}$  to 9 oz. shirtings, 16-oz. all-worsted suitings, 30-oz. melton overcoating, and blankets all of khaki color formed the greater part of the volume of the woolen business. Before the war, all army specifications called for all-wool fabrics without deviation and with a particular antipathy to the use of shoddy or overworked wool or cotton. At first the Quartermaster's Department, when extensive purchases of uniforms were required, decided to retain the all-wool requirements, but later it became evident that with the scarcity and the increased price of wool it would be desirable to change the specifications. In the case of the shirtings, a cotton-warp fabric was adopted in place of the all-wool cloth, but in the 16-oz. all-worsted suitings used for the uniforms, the officials would not consider any change in view of the hard and constant wear to which it was subjected, though in a few emergency orders, an inferior cloth was substituted. In the case of the overcoatings, it was agreed that the construction of 25 per cent cotton and 75 per cent all-wool would be accepted for a 30-oz. fabric, but later the Advisory Committee recommended the admixture of 35 per cent of reworked wool with 65 per cent of pure wool, while later fabrics made up were composed of 50 per cent of wool and 50 per cent of shoddy. In the case of blankets, no cotton was allowed, but the proportion of material was finally agreed upon as 65 per cent of pure wool and 35 per cent shoddy.

It must be remembered that the admixture of shoddy was a debatable question, and did not necessarily involve the suggestion of fraud with which the term had been identified in the American popular mind since the days of the Civil War. Shoddy is a technical term for reworked wool obtained from woolen rags, and has a shorter fabric than pure wool. It decreases the strength of the cloth but according to experts it does not materially decrease the warmth, and shoddy was considerably warmer than cotton. It was stated in this connection that more shoddy had been used in the fabrics ordered by various governments in the United States markets than in those supplied to the American army.

In the navy the same procedure that had been followed as regards purchases and qualities for a number of years was pursued, and with the exception of a couple of cloths all-wool was demanded in the various garments and other articles of equipment. Naturally, the navy was not as extensive a buyer as the army whose Quartermaster's Department came in for considerable criticism during an investigation at the end of the year by the Senate Military Committee. Up to December 29, 1917, the Army Quartermaster's Department had purchased over 19,000,000 blankets; 20,000,000 yards of overcoatings and more than 30,000,000 yards each of shirting flannel and suiting involving the expenditure of more than \$345,000,000.

**COTTON CLOTHS.** In cotton goods, the War Department had placed contracts for 250,000,000 yards of various cloths. In knitted goods the purchases had been as follows: winter drawers, 25,000,000 pairs; winter undershirts, 21,000,000;

wool gloves, 11,000,000 pairs; wool light weight stockings, 31,000,000 pairs; wool heavy weight stockings, 21,000,000 pairs. The cotton goods industry flourished during 1917 with exports nearly three times above the normal, and new demands developing through the shortage of lins and burlaps. Merchants, mills, stockholders, and operatives received greater profits than ever before, notwithstanding the high prices of cotton. Naturally the government became an important customer, and its demands were enormous along many lines. For example, at Fall River, government orders for 150,000,000 yards of bandage and hospital supplies were apportioned among various mills including those whose looms had never worked upon such material before. By the end of the year it was estimated that the government had secured or contracted for at least \$500,000,000 of cotton products, and it was stated that 60 per cent of a soldier's equipment consisted of cotton goods in some form or other. Up to November 1, cotton duck mills were engaged to full 80 per cent capacity, after that time no duck was sold to others than government workers except by permission of the Priorities Board. Looms used for carpets, quilts, heavy worsteds, and upholstery fabrics were utilized for cotton duck, and many of the mills normally engaged in the automobile trade returned to government fabrics. By July 9, 1917, an advance of 100 per cent in price of cotton duck products was announced, while the government obtained certain substantial discounts as a result of various conferences. The year was remarkable in the production of gingham which were used more freely than ever previously. The shirting business declined during the year, as also fine goods in dress wear. Sheetings were very active during the year and also the manufacture of cotton bags. Fancy cottons were in restricted demand on account of war time economies, and particularly the cheaper and fancy goods.

In 1917, more than \$13,000,000 was expended by Southern cotton manufacturers for increasing the number of spindles and looms. In some approximately 900 cotton mills of the South, 118,500 spindles and 4800 looms were contracted for by 28 established concerns, while 16 new enterprises invested over \$10,200,000 in plants that would house 407,000 spindles and 11,700 looms. The cotton consumed by Southern mills had been increasing from year to year and in 1910, 2,341,000 bales went to Southern mills and 1,993,000 to other American mills. In 1916-17, about 4,360,000 bales of the 13,000,000 bale crops were consumed by Southern mills and about 3,000,000 by the other mills of the United States, principally New England.

In Great Britain (q.v.), the Lancashire cotton industry worked under unusual conditions, a lagging trade for six months being succeeded by general activity with an increase in yarn and cloth prices greater than the increase in the raw material. As a result, spinners and manufacturers in 1917 made more money than for many years previously, but under unusual and difficult conditions. In June, 1917, the British Government appointed a Board of Control consisting of representatives of the Board of Trade of the Employees' Association, and of trade unions officials, to whom were given power to regulate prices in raw cottons and products

of yarn and cloths. There was a shortage in the supplies of American cotton, so that from September it was decided to reduce the output of the standing mills 70 per cent and in both spinning mills and weaving employers had to pay a levy on machinery running beyond 60 per cent, using the fund thus secured to compensate the operatives who were thrown out of employment. The first half of the year was not notable for a demand for cloth at the advancing prices, but by the summer an improvement set in and various customers were active buyers. Egypt and the South American markets were especially good customers, while at home the demand improved. The Government was a large purchaser and cloths were sold for the armies of France and Italy, while, as in other countries, aeroplane fabrics aroused considerable interest. In the beginning of 1917, operatives were receiving 10 per cent higher wages than at the outbreak of the war in August, 1914, and through the year there were various successive increases until towards the end the demand ran for added compensation, varying from 25 to 40 per cent. An agreement was reached that wages should be advanced 15 per cent, so that at the end of 1917, the increase over ante-bellum wages amounted to some 35 per cent.

**DYES.** There was no scarcity of coloring matters during 1917, and outside of the volume of the production of dyes, there was little dis-

It was interesting to note in the textile industry in the United States, development had been not only on the technical but on the commercial side in the dye industry, and had been formed on a proper basis. There was no reason why the United States should not be forever independent of Germany.

**WOOLENS.** In the manufacture of woollens during 1917, the purchases of the United States government predominated the industry and its markets. The various manufacturers allotted what surplus goods they had, and there was a patriotic response on all hands to help the government. The woolen industry was asked early in the war to coöperate in order to conserve supply of wool, which was rapidly advancing, and in many fabrics the increase in cotton and shoddy filled materials became general. The American manufacturers suffered from high prices and the scarcity of material, as Great Britain would not permit wool to come from Australia and the only foreign supplies of clothing wool were received from South America and South Africa. Towards the end of the year a small amount of Australian wools was permitted to enter the United States and was sold at auction.

The National Association of Wool Manufacturers reported as follows on active and idle machinery in the wool manufacture, December 31, 1917, with percentages of idle to total as reported:

MACHINERY REPORTED AS OF DECEMBER 31, 1917

	Wider Than 50-Inch Reed Space	Looms Under 60-Inch Reed Space	Carpets and Rugs	Cards	Combs	Spinning Spindles	
						Woolen	Worsted
In operation .....	39,624	11,417	8,045	8,690	1,756	1,241,662	1,410,822

tinctive in this branch of the industry, so rapidly had it adjusted itself to new conditions. For the first quarter of the fiscal year ended September 30, aniline dyes were valued at \$1,173,439, a figure that can be compared with the entire domestic production of aniline dyes for the fiscal year 1914, which was \$2,470,096. In other words, the United States was exporting chiefly to England and her colonies, surplus dyes equal to the value of the entire yearly production before the war. The first effect of the war was to secure adequate blue and black dyes, which together comprised about three-quarters of the total dyeing operations. In 1917, manu-

**TEXTILE MILL CONSTRUCTION IN 1917.** During 1917, according to the authoritative reports of mill construction, annually compiled by the *Textile World Journal*, there were 297 new mills built for the various branches of the textile industry. This figure had not been equalled previously since 1906, when 303 new mill projects were put under way. In 1916, the total mill construction was 280, and the average for ten years from 1907 to 1916 was 254 new mills. The comparison of mill construction for ten years is given in the accompanying table, which also indicates the distribution in the various industries of the new mills:

	1917	1916	1915	1914	1913	1912	1911	1910	1909	1908

facturers, in addition, were able to produce in the United States the brighter colors and to meet the demand for military and naval fabrics.

From this table it will appear that the miscellaneous plants, including dyeing, bleaching, and finishing works, and the silk industry were

responsible for the large increases over 1916.

Taking up the various industries, it will be found that of the 52 new cotton mills, the largest number were established in North Carolina, which State also led in the average importance of the various projects. New cotton mills were added in Alabama, Georgia, South Carolina, Texas, and Tennessee. There were naturally a number of enlargements and improvements by old established mills, which as usual were in many cases more important than the new constructions. The new mill built by the Penrod Mills at New Bedford, Mass., for tire fabrics, a mill for fine-combed yarns at Gastonia, N. C., by the Ranlo Manufacturing Company, and a similar mill at the same place for the Smyre Manufacturing Company were among the notable new constructions of the year. The various enlargements and improvements were made by such concerns as the California Cotton Mills, Oakland, Cal.; the West Point (Georgia) Manufacturing Company; the Pacific Mills at Lawrence, Mass.; and a number of others in all parts of the United States.

As regards the 24 new woolen and worsted mills, 9 were in New England, 6 in Pennsylvania, and 1 each in California, Illinois, New Jersey, New York, Ohio, Oregon, Tennessee, Utah, and Wisconsin. Most of these were small, the most notable new mill being perhaps that of the Norwich (Conn.) Woolen Company. At Warren, R. I., the Narragansett Worsted Mills of the American Woolen Company was the latest addition to the manufacturing resources of that company.

The knitting industry continued to grow in 1917, although there were but 97 new projects reported, as against 113 in 1916, or an average of 110 for 10 years. Many corporations were ready to build and extend, but difficulty in securing machinery and supplies was largely responsible for the decreased figures. The new knitting mills for the most part were located in Southern States, 46 new plants, chiefly hosiery projects, being in this section, with North Carolina alone accounting for 25 and Tennessee for 12. Pennsylvania had the largest number of new knitting mills with 26, but the South was increasing as a factor in this industry. In addition to the new constructions, there were also important enlargements and improvements throughout various parts of the country.

The silk industry still continued to concentrate in New Jersey and Pennsylvania, as 66 of the 96 new mills were reported for these two States. Paterson, N. J., alone had 38 new silk mill projects, most of them being for broad silk weaving plants of a few looms.

As regards the miscellaneous new mill constructions of 1917, there were 16 plants for dyeing, bleaching, finishing, printing, mercerizing, or otherwise processing textile products in various forms. The war had made but little difference in the demand for the products of raw stock bleaching and cotton plants, and only one new mill in this line got under way during the year.

**FOREIGN TRADE IN TEXTILES.** The foreign trade in textiles in the United States for the fiscal year ending June 30, 1917, was in many respects remarkable. The cotton goods exported reached a total value of \$136,253,858, where the highest figures known before the war had been less than \$56,000,000. The trade with South

America showed a material increase, the exports of cloth alone aggregating 166,134,044 yards, as compared with 91,720,850 yards in 1916 and 35,870,895 yards in 1915. The amount of cotton goods exported to Mexico was nine times in excess of the trade in 1915, while Canadian trade in cloth was three times the yardage of 1915. On the other hand, the trade with the Far East, which before the war was considered to be the most important foreign market for American cotton goods outside of Cuba, the West Indies, and the Philippines, declined to very small proportions. The exports of wool during 1917 amounted to \$27,327,451, as compared with \$53,983,655 in 1916, and \$18,423,556 in 1915. Wearing apparel was the leading item and France was the largest customer, followed by Great Britain and Canada. The imports of cotton goods in the fiscal year 1917 were valued at \$56,181,684, which approximately was very close to the average of the years before the war. More cotton goods were imported from the United Kingdom in 1917 than in the previous years, the amount totalling \$13,163,620, as compared with \$7,397,162. The imports of unmanufactured wool in the United States in 1917 aggregated in value \$131,137,170, as compared with \$142,420,734 in 1916 and \$68,242,568 in 1915. The total manufacture of wool amounted to \$18,862,463 in 1917, as compared with \$15,657,537 in 1916 and \$29,791,356 in 1915. The imports of raw silk in 1917 were valued at \$160,571,808, as compared with \$124,333,655 in 1916 and \$83,130,557 in 1915. The imports of manufactured silk in 1917 were valued at \$40,322,840, as compared with \$31,911,793 in 1916 and \$25,042,670 in 1915. The manufactures of artificial silk fell to \$1,523,939 in 1917 from \$3,102,089 in 1916. The total manufactures of linens and burlaps amounted in 1917 to \$78,955,185, as compared with \$68,445,531 in 1916.

**THEOSOPHICAL SOCIETY, THE.** In 1917 the American section of the Theosophical Society had 6641 members and 184 churches. The total membership of the society was about 30,000. Altogether, since the Theosophical Society was founded in 1875, more than 1400 branches have been established. At the end of the fiscal year, June 30, 1917, the balance of cash in the treasury was \$7269. Thirty new lodges were organized in the fiscal year. The national president of the American section is A. P. Warrington and the national headquarters are at Krotana, Hollywood, Los Angeles, Cal. The national secretary is Craig P. Garman. The general headquarters of the society were removed in 1879 from New York City to Adyar, Madras, India, and there the president, Mrs. Annie Besant, resides. Branches of the society have been established in all parts of the world.

**TIBET.** A Chinese dependency in central Asia. Estimated area, 756,000 square miles, including Koko-Nor and Tsaidam. Estimated population, 2,000,000. The capital is Lhasa, with an estimated population of 15,000 to 20,000, including a large number of Buddhist monks. To some extent grazing and a primitive agriculture are carried on, and gold, borax, and salt are worked. The trade is principally with China and India.

**TIOK.** See VETERINARY MEDICINE.

**TIMBER.** See FORESTRY.

**TIN.** The production of tin throughout the

world in 1917 was approximately 135,000 short tons, or about the same as in 1916. The output of the Federated Malay States continued to decline, but this decline was more than counter-balanced by the heavy increase in the production of Bolivia, amounting to 8000 tons. There was an increase in the cost of production, and an increase in prices, which reached a maximum monthly average of 87.12 cents in New York in December. The average price for the year was 61.80 cents, as compared with 43.48 cents in 1916, and 38.59 in 1915. There was a tendency for stocks to increase and for consumption to decline. The difficulties and high rates of freight and legislation and hostile interference with shipping acted to develop uncertainty in the tin markets. In the United States the tin industry naturally was hampered by the prevailing scarcity of steel, although it was fairly active during the year. There was not, however, any great enlargement of the capacities of existing plants. The United States Geological Survey reported the production of tin in the United States in 1916 as 280,000 pounds, valued at \$121,744, as compared with 204,000 pounds, valued at \$78,846 in 1915. See **CHEMISTRY, INDUSTRIAL, Metals.**

**TIROL.** An Alpine crownland of Austria, constituting the greater part of the administrative district of Tirol and Vorarlberg. North of Tirol is Bavaria; east, Salzburg and Carinthia; southeast, the Italian compartimento of Venetia; west, the Italian compartimento of Lombardy, the Swiss canton of Grisons, and Vorarlberg. Area, 10,302 square miles; population, according to the census of December 31, 1910, 946,613.

**TOBACCO.** The tobacco crop of the United States in 1917 was the largest ever grown, estimated at 1,196,451,000 pounds. This compared with 1,153,270,000 pounds in 1916, and the five-year average of 983,723,000 pounds. The increase was due to increase both in the acreage and the acre-yield. Prices were unusually high, the average being nearly 25 cents, or 10 cents more than in 1916 and more than twice the average price for 1911-15. The result was a farm value for the 1917 crop estimated at \$297,442,000, or nearly three times the five-year average.

The United States Internal Revenue report for the fiscal year 1917 showed large increases in tobacco taxes all along the line. The output of cigars was the largest ever recorded—8,266,770,593, representing an increase of 876,587,423 over 1916. Tax was also paid on more than 30 billion cigarettes, an increase of nearly 50 per cent. There were 35,377,751 pounds of snuff manufactured, over 2,000,000 pounds more than in 1916, and 445,763,206 pounds of smoking and chewing tobacco, an increase of over 28,000,000 pounds.

The total internal revenue from tobacco manufacturers amounted to \$103,201,592.16, or over \$15,000,000 more than in 1916. The largest revenue was from cigarettes, which paid taxes aggregating more than \$38,000,000, followed by cigars with over \$25,000,000, and manufactured tobacco with over \$35,000,000. The special taxes (not including the new war tax) returned nearly a million dollars. The new revenue laws passed during the year impose special war taxes on cigars, cigarettes, and other tobacco manufactures and also upon the busi-

ness of tobacco manufacturing. These taxes, together with the generally high prices of leaf tobacco, quite materially increased the cost of the manufactured products to the consumer.

**TOBAGO.** See **TRINIDAD AND TOBAGO.**

**TOGO.** A German protectorate in West Africa, on the Guinea coast between Dahomey (French) and the Gold Coast (British); held by the Entente Allies since 1914. It has a smaller area, but a larger average population per square mile, than any of the other German possessions in Africa. The estimated area is 87,200 square kilometres (33,668 square miles), which is a little larger than the State of Maine. A German estimate made shortly before the great war placed the colored population at 1,032,000. White inhabitants January 1, 1913, numbered 368, of whom 320 German. The protectorate was established in 1884. In August, 1914, it was invaded by French and British forces, and by the 25th of the month the conquest of the country was complete. Togo is divided provisionally into two parts, one administered by the government of the Gold Coast and the other by that of Dahomey. The German administrative headquarters was Lome.

The soil in the coast region is fertile, and to some extent the natives cultivate corn, yams, manioc, bananas, ginger, etc. The forests contain oil-palms, rubber trees, and dyewoods. Imports and exports in 1913 were valued at 10,631,000 and 9,138,000 marks respectively. About one-half the trade was with Germany. Exports in 1913 included: Palm kernels, 2,558,000 marks; raw cotton, 582,000; palm oil, 518,000; rubber, 360,000; cattle, 334,000; cacao, 333,000; silver coin, 3,195,000. There are three railways, metre gauge: Lome-Anecho, 27 miles; Lome-Palime, 74; Lome-Atakpame, 102; total, at end of 1913, 203 miles. The budget for 1915-16, as well as for 1914-15, balanced at 4,177,943 marks, the estimated receipts being almost wholly local and derived mainly from customs duties.

**TOLEDO HIGH PRESSURE SYSTEM.** See **FIRE PROTECTION.**

**TONGA,** or the **FRIENDLY ISLANDS.** Three groups of South Sea islands, constituting a British protectorate. Area, 390 square miles. Population, 23,011 Tongans, 346 other Pacific islanders, and 380 Europeans. The natives are Christians, mostly Wesleyans. The capital is Nukualofa.

**TONKING.** The most northerly division of the colony of French Indo-China, bounded on the north by the Chinese provinces of Yunnan and Kwangsi. Hanoi, the capital, is also the capital of French Indo-China. The chief crop is rice; others of importance are sugar cane, cotton, cardamoms, corn, and tobacco. See **FRENCH INDO-CHINA.**

**TORPEDO-BOAT DESTROYERS.** See **BATTLESHIPS AND OTHER WAR VESSELS; NAVAL PROGRESS; SUBMARINE OPERATIONS; SUBMARINES.**

**TORPEDO-PLANES.** See **NAVAL PROGRESS.**

**TORONTO, UNIVERSITY OF.** An institution of higher learning, at Toronto, Canada. In the fall of 1917 there were 2436 students and 393 members of the faculty. Approximately 4000 graduates and undergraduates had enlisted for military service at the end of the year. More than 400 graduates and undergraduates of the university had fallen in battle. The valuation

of the assets of the university, including lands, buildings, and investments was for the year ending June 30, 1917, \$7,098,572. Income for the same period from investments was \$56,082; from government grants was \$526,155; from fees was \$188,425; and from other sources was \$84,091. President, Robert A. Falconer, K.C. M.G.

**TOBRINGTON, FREDERICK HERBERT.** A Canadian musician, died November 20, 1917, at Toronto. He was born in Dudley, Worcestershire, England, and in 1853 became organist at St. Anne's, Bewdly. Later he emigrated to Canada and in 1857-69 he was organist at Great St. James's Street Methodist Church, Montreal. He was organist and musical director at King's Chapel, Boston, in 1869-73, and also professor in the New England Conservatory of Music; in 1873-1907 he was organist and choirmaster at the Metropolitan Church at Toronto, Canada, and became conductor of the Philharmonic Society there. Under his direction the first Toronto musical festival was held in 1886 and in 1888 he founded and was appointed director of the Toronto College of Music, an institution that has exercised a markedly beneficial influence upon the musical culture of the Dominion. He conducted the Toronto musical festivals in 1895 and 1896; and in 1903, with Sir Alexander Campbell Mackenzie, was associate conductor of the cycle of musical festivals in that city. In 1892 he was elected president of the Canadian Society of musicians. Among his works are organ music, choruses, hymn tunes, and services.

**TRACK AND FIELD ATHLETICS.** See **ATHLETICS.**

**TRACTORS IN AGRICULTURE.** See **AGRICULTURE.**

**TRADE CONTROL.** See **FINANCIAL REVIEW.**

**TRADE FAIRS.** See **EXPOSITIONS.**

**TRADE UNIONS.** The year was notable for the increased prominence given to labor organizations and leaders in connection with industrial problems of war time. In the United States the American Federation of Labor (q.v.) conspicuously aided the government, while, on the other hand, the Industrial Workers of the World (q.v.) were never more successful in disturbing industry or interrupting the plans of the administration. The intense loyalty of a large proportion of American labor was shown in the refusal of the Executive Council of the American Federation of Labor to send delegates to an international conference of trade unionists to be held in Switzerland in September to discuss union demands for peace. The calling of this conference was ordered June 8 by trade unionists from Holland, Denmark, Norway, Sweden, Finland, Germany, Austria, Hungary, and Bulgaria in convention at Stockholm. President Gompers cabled that the proposed conference was "premature and untimely." The conclusion of the Danbury Hatters' boycott case (see below) and certain decisions on the use of the injunction (q.v.) were of great interest to union labor. Labor organizations abroad were generally in strong sympathy with their respective governments, though counter notes were not infrequent and in Spain a general strike was inaugurated for political purposes. Consult also the following articles: **LABOR; ARBITRATION AND CONCILIATION, INDUSTRIAL; STRIKES.**

**DANBURY HATTERS.** Another chapter in the history of the famous boycott of the United

Hatters of North America against Loewe and Company of Danbury, Conn., was written on June 7, when Judge Thomas of the United States District Court ordered the sale of the homes of 140 of the defendant hatters at Danbury, Bethel, and Norwalk. The case grew out of a strike begun in July, 1902; the boycott was carried out with the assistance of the American Federation of Labor; suit was begun under the Sherman Anti-Trust Law for the recovery of three-fold damages in December, 1903. At that time the United Hatters agreed in writing with each defendant "to pay all expenses of such defendants and to save each individual from all liability." The case was carried back and forth by the American Federation of Labor until the final decree of the United States District Court of Appeals in 1913. Thereafter the Federation collected a voluntary contribution amounting to \$150,000. Final settlement was reached in July, when the prosecuting concern agreed to accept this sum as full compensation, \$80,000 having already been paid by the Hatters' Union. Thus the homes of the individual hatters were saved to them. See **INJUNCTION.**

**RIGHT TO SOLICIT.** On December 10 the United States Supreme Court, by a vote of 6 to 3, declared that under certain conditions trade union members did not have the right to solicit non-members to join them. The Hitchman Coal and Coke Company and the Eagle Glass Manufacturing Company, both of West Virginia, had established the "open shop" and employed non-union labor. Union representatives sought to induce the employees to join them with a view to compelling the concerns to unionize their plants. Judge Dayton of the United States District Court granted the companies injunctions against such soliciting and it was his action that the Supreme Court sustained. This court recognized the right of workmen to form unions and of employers to maintain the "open shop." In the case at hand, however, the purpose of the unions was not to increase membership so much as to compel the objecting companies to change their methods of business. The union delegates sought to induce employees to break contracts into which they had voluntarily entered and thus to coerce employers. Against such action the employers were entitled to protection.

**POST OFFICE DEPARTMENT.** Considerable interest was manifested in the attitude of Postmaster-General Burleson toward the organization of postal employees. Although President Wilson and other members of the Cabinet had shown great favor for the recognition of unions as a necessary condition to the preservation of industrial peace and efficiency in war time, and although the government had set up adjustment boards for all concerns doing work for the War and Navy Departments (see **ARBITRATION AND CONCILIATION, INDUSTRIAL**), Mr. Burleson strongly opposed the further developments of the postal service unions. His attitude was severely condemned by the American Federation of Labor (q.v.). Postal unions were permitted by act of Congress on August 24, 1912. Such employees were given the privileges of presenting grievances to Congress and affiliating with other organizations, but they were not allowed to strike. At various times they sent petitions to the postmaster-general, but these were not acknowledged; they sent delegations but these

were not received. In his annual report Mr. Bursleson accused the union officers of presenting "imaginary grievances," "distorting or misrepresenting the facts," and weakening loyalty and discipline. He charged that the unions were becoming bold; that he feared a strike in the future; and that this would be a revolutionary menace to the government. On the other hand, the unions claimed that they had received no advance in pay in ten years and that the increasing discontent with unprogressive management was the sole basis of the increasing insistence with which they pressed their grievances.

**WOMEN.** The National Woman's Trade Union League, under the presidency of Mrs. Raymond Robins, has actively aided the National Consumers' League in its propaganda for the universal eight-hour day and forty-eight hour week for women workers. It cooperated with Federal authorities in 1917 in the protection of women drawn into war trades (see **WOMEN IN INDUSTRY**). At its sixth annual convention at Kansas City, June 4-9, a resolution was adopted requesting the American Federation of Labor to include trade union women in its delegation to the International Labor Peace Congress at the close of the war. It was urged that the working women of all nations should convene in a similar congress and make known their unified demands for international standards for women workers. Other resolutions protested against limitations of the constitutional rights of freedom of speech, press, and assemblage; protested against the abrogation of labor standards during the war; demanded the conscription of wealth whenever men should be conscripted; favored vigorous efforts to extend labor organization; condemned the undercutting of American standards by coolie labor; and demanded equal pay for equal work regardless of sex. Owing to opposition of foreign governments, delegates from the British Women's Trade Union League, Australian and French women workers, and the Intersyndicalist Committee for Action against Exploitation of Women were not present.

The league opened in January, 1914, at Chicago, the School for Active Workers in the Labor Movement. This has been very successful. It trains students who either come of their own initiative, or are sent by local unions, or are selected by the league itself to become the active leaders in the organization of working women. There is an academic course of four months covering English, public speaking, court decisions, labor problems, economic history, elementary economics, and modern radical movements, and eight months' field work, including practical experience with many real problems. Some of the academic courses are taken at the School of Civics and Philanthropy and the University of Chicago.

**GREAT BRITAIN.** The labor movement in Great Britain is carried on through three federated bodies: Federation of Trade Unions, the Trade Union Congress, and the Labor Party. By all odds the most important organization is the Trade Union Congress, which held its forty-ninth annual meeting at Blackpool, September 3-8. This session was attended by 692 delegates representing 174 organizations with 3,068,992 members. Some of these organizations were themselves federations, so that a total of

260 unions were actually represented. The total membership comprised about 75 per cent of all members of the 1106 unions in the United Kingdom. Its aggregate membership was 8.3 per cent greater than in 1916, this increase occurring mainly among general laborers, railway men, and in the clothing and engineering trades. Among the principal subjects upon which resolutions were passed were the following, as reported in the September *Labour Gazette*: "An improved scale of war pensions; a proposed international labor and Socialist conference at Stockholm; joint action by all unions to secure an increase in wages; extension of the Trade Boards Act; reduction of working hours in all trades to forty-eight per week; the conscription of wealth; the machinery required in connection with the demobilization of the army and of munitions labor, and the reinstatement of the men in their old employment; reorganization of unemployment insurance; the practices employed by enemy submarine commanders; increased separation allowances, and increased pay to soldiers and sailors; free trade; the metric system; government control over food supplies and prices; the Russian revolution; compulsory military service; the Defense of the Realm Acts; the administration of the Liquor Control Board; educational reform; electoral reform; housing reform; enlargement of the powers of the Ministry of Labor; national ownership and control of land; the lowering of the income tax exemption level; and the nationalisation of canals and waterways."

**CANADA.** The Sixth Annual Report on Labor Organization in Canada covering the calendar year 1916 shows that the total union membership fell from 175,799 on December 31, 1913, to 143,343 on December 31, 1915, but rose to 160,407 on December 31, 1916. The increases in the latter year were most marked in the metal, clothing, and railroad trades, while the building trades showed no advance. There were 91 branches of international organizations in Canada, of which 84 were connected with the American Federation of Labor; these comprised 129,123 members. The most important centralized labor group in the Dominion is the Trades and Labor Congress.

The beneficiary disbursements made by 80 of the 91 international organizations, the other 11 having no beneficiary features, for 1916 were as follows: death, \$7,708,000; unemployment and traveling, \$106,000; strike, \$2,811,000; sickness and accidents, \$1,120,000; old age pensions, \$461,000; other, \$194,000; total, \$12,500,000. With reference to military service, 1284 local unions reported 21,599 enlistments, besides 593 British reservists who had joined their regiments. These enlistments account for the decline in membership 1914-15. There was a noticeable lack of agreement on the question of the registration of the man power of the Dominion. The Trades and Labor Congress declared it to be the duty of labor to assist in every possible way in the prosecution of the war; but this Congress and the Canadian Federation of Labor opposed conscription for military service.

**TRADING WITH THE ENEMY ACT.** See **FINANCIAL REVIEW**.

**TRANSPORTATION FACILITIES.** See **UNITED STATES AND THE WAR**.

**TRANSVAAL.** One of the four original provinces of the Union of South Africa (q.v.).

Pretoria, the capital of the Union, is also the seat of the provincial government.

**TRANSYLVANIA.** A titular grand principality, forming the eastern part of Hungary. It is sometimes not regarded as a part of Hungary proper, as not much over one-third of the population is Magyar. Area, 22,318 square miles. The population, according to the census of December 31, 1910, was 2,678,367, as compared with 2,476,998 in 1900. In 1910, Rumanian was the mother tongue of 1,472,021 inhabitants (55.0 per cent); Hungarian, 918,217 (34.3 per cent); German, 234,085 (8.7 per cent). Of the population in 1910, adherents of the Orthodox Church constituted 29.6 per cent; Greek Catholics, 28.0; Reformed, 14.9; Roman Catholics, 14.0; Evangelicals (Augsburg), 8.6; Unitarians, 2.5; Jews, 2.4. The chief town is Kolozsvár (Klausenburg), which has a university, and which, after Budapest, is regarded as the most important intellectual centre in Hungary; it had in 1910 60,808 inhabitants. Other towns are: Brassó (Kronstadt), 41,056; Maros-Vásárhely, 25,517. It was the annexation of Transylvania that was Rumania's aim in entering the great war.

**TREE,** Sir HERBERT BEERBOHM. An English actor manager, born in London December 17, 1853. He died in London on July 2. He was one of the most versatile of English actors and considered by many the successor to Irving. He made his début in 1877 at the Globe Theatre in London. In 1884 he made a very successful appearance in *The Private Secretary*. From that time on he undertook the management of theatres, as well as continuing to act. From 1887 to 1896 he managed the Haymarket, where he produced among other plays, *Trilby*. In 1897 Tree opened Her Majesty's Theatre with *The Seats of the Mighty*, after having produced many successful plays. His fame rests chiefly on his elaborate production of Shakespearean plays, in most of which he played a leading part. A Shakespearean Festival inaugurated by him in 1905 was extremely successful. In 1907 he visited Germany at the invitation of Emperor William, but was not very enthusiastically received by the German critics. During his visit he was invested with the Third Class Order of the Prussian Crown. In 1909 he was knighted by King Edward. In 1916-17 he was in the United States, where he appeared in a Shakespearean repertoire, and in an adaption of Thackeray's *Colonel Newcome*. He made a brief tour of the country and returned to England in May, 1917. In 1913 he published *Thoughts and Afterthoughts*.

**TRENCH FEVER.** Pappenheim, of the British General Hospital No. 1, has been conducting researches to discover, if possible, the specific germ responsible for this disease. He has isolated an organism from a number of patients and has cultivated it on artificial mediums. The organism is found in the periosteum, and also around the blood vessels of the tibialis anticus muscle, but not in the muscle itself, where the pain of the disease is located. It has also been found in the blood in a few cases. The organism is described as disc-shaped, about one-thirtieth to one-fortieth the size of a red blood corpuscle, and stains with the Wright-Giemsa stain, heated with hematoxylin after being fixed with Zenker's solution, hot Azure 2 stain, Ziehl-Neelsen, and even with the hot weak carbol-

fuchsin stain. It is significant that the micro-organism is also found in the stomach walls of the body louse, which would seem to involve these vermin in the communication of the disease.

Dr. Milton Mandel, medical director of the United States Army Base Hospital No. 12, describes the malady after having seen several hundred cases, but considers the character of infection as yet undetermined. He says also that the name is really a misnomer, since the disease develops in troops that have not been in the trenches and even in individuals who have only occasionally visited training camps and convalescent hospitals. According to Mandel the disease is a distinct clinical entity, and may be defined as "an acute infectious disease of unknown etiology and self-limited course, characterized clinically by cyclic febrile attacks, intense headache and backache, and pains over the tibiae which are particularly severe at night." One attack does not confer immunity. After a slight indisposition, there is a sharp rise of temperature from 101° to 104° F., preceded by chilly sensations or a true rigor, and followed by the symptoms mentioned above. The fever declines in from one to three days to normal and then follows another similar febrile attack. The cycle may be repeated a number of times, but as a rule convalescence is established after the third rise. The skin pains often persist for months after all other evidences of the disease have disappeared.

**TRIESTE.** A crownland of Austria, consisting principally of the important Adriatic seaport city of Trieste. Area, 36.8 square miles. The population, according to the census of December 31, 1910, was 229,510, as compared with 178,599 in 1900; as estimated in 1914, 246,500. The city of Trieste had in 1910 160,993 inhabitants. In 1910 the number of Austrian subjects in the crownland was 190,913; of these, Italian was the vernacular of 118,959 (62.31 per cent); Slovenian, 56,916 (29.81 per cent); German, 11,856 (6.21 per cent); Croatian, 2403 (1.26 per cent). Of the population in 1910, Catholics numbered 217,846 (94.92 per cent); Evangelicals, 2472 (1.08 per cent); Orthodox, 1981 (0.86 per cent); Jews, 5498 (2.40 per cent). The crownland has a unicameral diet of 80 members and is represented by 5 members in the Austrian Reichsrath.

**TRINIDAD AND TOBAGO.** A British colony, composed of the West India islands of Trinidad (1754 square miles) and Tobago (114). Total population, 333,552 (110,911 East Indians). Estimated population March 31, 1914, 352,145. The capital is Port of Spain (56,796 inhabitants); San Fernando (8667) is 30 miles south of the capital.

**TRINITY COLLEGE.** A non-sectarian institution for the education of men at Hartford, Conn. In the fall of 1917 there were 166 students and 22 members of the faculty. Volumes in the library numbered 80,000 and there were also 45,000 pamphlets. Odell Shepard was appointed James J. Goodwin professor of English in 1917, the professorship having been established by a gift of \$50,000 from Mrs. Goodwin. A bequest of \$150,000 was also received from the J. P. Morgan fund. Productive funds in 1917 amounted to \$1,617,992 and the income to \$83,895. The college was founded as Washington College in 1823 by members of the Protestant

Episcopal Church and the name was changed in 1845. President, Flavel Sweeter Luther, LL.D.

**TRIPOLI.** See LIBYA.

**TROTZKY, LEON.** Russian ultra pacifist and, with Nikolai Lenine (q.v.), the leader of the Russian Bolsheviks. His real name is Leber Bronstein. He is about 40 years old. He established a paper in Russia more than 15 years ago and on account of his revolutionary ideas was often sent to jail. He was sent to Siberia from 1905 to 1912 for participation in revolutionary plots. After his release he went to Berlin, where he established a paper, but after the war broke out he was ordered to leave. He lived a short time in Switzerland, and then went to Paris, where he started a paper advocating peace. The Russian Ambassador had his paper suppressed, and he went to Spain, where he was arrested. After his release he came to New York City, where he became editor of the *Novi Mir* (*New World*), a Russian revolutionary paper published in that city. He was also prominent in radical circles on the East Side of that city. After the overthrow of Czar Nicholas he returned to Russia. For his activities during the Russian Revolution, see the article on RUSSIA, *History*; see also WAR OF THE NATIONS.

**TRUCKS, MOTOR.** See AUTOMOBILES.

**TRUSTS.** There were no spectacular developments in the regulation of combinations in restraint of trade during 1917, though numerous prosecutions were under way; on the other hand, the sentiment which had been developing from the outbreak of the European war in favor of permitting American manufacturers to combine in the development of the export trade culminated in the passage, in December, of the Webb Bill to conference committees of Senate and House. This bill authorized combinations of American manufacturers and traders for the purpose of developing export trade. With reference to prosecutions the attorney-general in his annual report for 1917, dated December 4, stated that there had been many complaints of alleged violations of the anti-trust laws in consequence of the abnormal advances in prices. He pointed out that such advances were subject to the regulation of the Department of Justice only when they resulted from combination or conspiracy of producers or middlemen. Those increases due to scarcity or to the "common selfish impulse of traders to take advantage of the extraordinary conditions of the times," and those advances due to purely local action were beyond his powers of regulation. However, the Bureau of Investigation of the department, its various agents throughout the country, and the Federal district attorneys had all cooperated vigorously to carry on inquiry as to the existence of grievances or conspiracy in restraint of trade. During the fiscal year 1917 18 cases were instituted—6 civil and 12 criminal; and 15 cases were settled—7 civil and 8 criminal. There were pending in December 37 cases—19 civil and 8 criminal. Of these 37 cases, 14 had reached the Supreme Court, including cases against the Reading Company, the Lehigh Valley Railroad, the International Harvester Company, the United States Steel Corporation, United Shoe Machinery Company, the Eastman Kodak Company, the Motion Picture Patents

Company, the American Can Company, the Corn Products Refining Company, the Southern Pacific-Central Pacific Railway Company, and the Quaker Oats Company. Late in December it was reported that the government had decided to discontinue prosecutions until after the close of the war, because the reorganization of illegal concerns involved financial demands that would interfere with war financing.

**CASES CONCLUDED.** Cases had been instituted against associations of lumber dealers in Minnesota, Michigan, Colorado, and Wyoming. The case against Hollis and others in Minnesota was decided on August 10, 1917, the contentions of the government being sustained in every particular. It was expected that in view of this decision the other lumber cases would be settled by consent decrees. Another group of cases instituted in district courts in Iowa, Utah, and western Pennsylvania involved dealers in plumbing supplies. The Iowa and Utah cases decided in 1916 resulted in the defendants in the Pennsylvania case, the National Association of Master Plumbers and their State and local affiliations entering pleas of *nolo contendere*. They had been charged with "concertedly refusing to sell goods which they did not themselves install and refusing to install goods which they did not themselves sell." They were fined amounts aggregating \$5265. An equity case against this same Pennsylvania group was not contested and a decree enjoining them from committing the acts complained of was entered on May 19.

Another group of cases which aroused national interest were two prosecutions of conspiracies to restrain the manufacture and shipment of munitions of war in and from the United States. These cases involved agents of the German government and were important factors in arousing the American people to a realization of the necessity of war. In the northern district of California was instituted a case against Franz Bopp, German consul general at San Francisco, and several others. The defendants were convicted and sentenced to one year in prison; Bopp and three others were in addition sentenced to pay fines of \$5000 each. In the southern district of New York was instituted the case against Von Rintelen, Martin, Lamar, Buchanan, Taylor, Fowler, Schulteis, and Monnett. The first three of these were found guilty and sentenced to imprisonment of one year each. The case against Monnett was dismissed, and the jury disagreed with reference to the others.

The National Retail Monument Dealers' Association of America and certain officers and members were indicted in the United States District Court of Maryland for restraining commerce in monuments and memorials. Their method was to circulate so-called "honorary lists" of producers, manufacturers, and wholesalers who conspired to prevent so-called illegitimate retailers and ultimate consumers from securing these articles and who also agreed to purchase their own supplies of these articles only from persons on the lists. On September 12, 1917, the defendants entered pleas of *nolo contendere* and were fined amounts aggregating \$6255.

The Woven Label Manufacturers' Association with headquarters at New York City and comprising nearly all the manufacturers of woven

labels, hangers, tabs, and similar articles, adopted rules, regulations, and policies designed to control the entire trade in these articles from producers to consumers. The association adopted fictitious schedules of costs, fixed uniform prices and terms of sale, and maintained what was in effect a blacklist. A petition filed against them on October 8 resulted in an immediate agreed decree dissolving the association and the issue of an injunction enjoining the formation of a similar one.

The smokeless coal cases constituted another important set of prosecutions. Investigations in January and February, 1917, had shown that the Aileen Coal Company and others comprising 108 corporations and 59 individuals had entered into a combination to monopolize and raise the price of semi-bituminous or smokeless coal, known as New River coal and Pocahontas Coal. Also that the Algoma Coal and Coke Company and a large number of other corporations and individuals had sought to eliminate competition by selling their product through a common sales agency, Castner, Curran, and Bullitt. The investigation finally showed that the Baker-Whitley Coal Company and numerous other organizations and persons had sought to restrain trade in the so-called bunker coal. After trial of a month the defendants in the Aileen case were acquitted on July 12. A week later the government *nolle prossed* the Algoma case, it being similar to the foregoing. Since nearly one-half of the defendants in the Aileen case were also involved in the Baker-Whitley case their pleas of *autrefois acquit* were sustained by the court on July 20, and the indictments of the other defendants were dismissed.

The only other cases finally determined were the ocean transportation cases involving the Prince Line (Ltd.) and others, and the American Asiatic Steamship Company. These defendants were charged with an effort to monopolize ocean transportation between the United States and South America and Far Eastern ports respectively by means of pooling agreements, rebates, and other secret trade arrangements. The Federal District Court decided both cases adversely to the government, which appealed to the Supreme Court. On January 22 this court reversed the decrees of the lower court, but because the European war had effectively dissolved the agreements the cases were remanded to the lower courts with directions to dismiss the indictments without prejudice.

**PENDING SUITS.** The defendants in suits still pending in December, 1917, were as follows: The Association of Bill Posters of the United States and Canada; the Board of Trade of the City of Chicago; the Keystone Watch Case Company; the American Sugar Refining Company; Michael Artery et al., Michael Boyle et al., so-called business agents of Chicago labor unions who conspired to prevent the unloading of goods at that city, and to prevent the installation in Chicago of electrical appliances and lighting fixtures manufactured elsewhere; John D. Rockefeller and four other defendants in the New Haven case; Charles S. Mellen and others charged with conspiring to prevent the construction of railroad lines in New England by the Grand Trunk Railway Company; Isaac Whiting and others charged with seeking a monopoly of trade in milk in New England; the

Booth Fisheries Company, charged with fixing the price of fish in certain parts of the country; the Western Cantaloupe Exchange and others; Cowell and others who were the officers and agents of nine cement manufacturing companies seeking a monopoly on the Pacific Coast (some of the defendants plead guilty on April 30 and were fined amounts totaling \$10,000); the Pan-American Commission Corporation and a South American agent which sought a monopoly of sisal, widely used in the manufacture of binder twine; the Jensen Creamery Company and others of Idaho; Simpson and others charged with conspiring to fix the price of milk in the District of Columbia; Mead and others charged with fixing the price of newsprint paper and otherwise controlling its supply (see below); the Chicago Mosaic and Tiling Company which sought to restrain trade in wall and floor tiles; M. Piowaty and Sons who with others was charged with forming the National Onion Association to control the prices and supplies of onions; Gilman and other members of the Chicago Butter and Egg Board; the United States Fish Exchange and others; various bread and baking companies of the District of Columbia; Webster and other members of the National Association of Automobile Accessory Jobbers who sought to control the trade in automobile accessories by combination and lists of legitimate jobbers; Nash Brothers and others indicted in North Dakota for conspiring to regulate interstate trade in fruits of certain northwestern States.

**SOUTH AFRICAN STEAMSHIP CASE.** On March 16 the Supreme Court handed down an important decision in the case of Thomsen and others v. Kayser and others involving the legality of the South African Steamship Conference. This conference represented an arrangement for fixing freight rates and otherwise controlling shipments from the United States to Africa. The lines involved agreed to pay a commission of 10 per cent of the freight to shippers using their lines exclusively in both import and export trade. It was estimated that this arrangement gave the conference excess profits of about \$1,500,000. The case had passed through the Federal Circuit Court and the Circuit Court of Appeals. The latter court had declared that whether the conference established a combination that was unreasonable restraint of trade was immaterial. The Supreme Court not only declared the combination illegal but severely condemned its maintenance of so-called "fighting ships," in order to cut rates, and other methods of unreasonable competition. The conference was declared to be an unreasonable monopoly under the Sherman Law and the decision of the Circuit Court of Appeals dismissing the case was reversed. The immediate importance of the case was reduced by the disorganization of shipping by the war. Its importance after the war, however, assuming a return of international trade to normal competitive conditions, is evident, since it might prevent such arrangements among American shipping companies as would make them most efficient in competition with other countries.

**NEWSPRINT MANUFACTURERS ASSOCIATION.** Early in the year there was complaint throughout the country of the extortionate prices of newsprint paper. The Federal Trade Commis-

sion, after investigation, reported in February that there was no real shortage of paper but that this association was securing unreasonable profits by means of combination. On March 3 the manufacturers agreed to permit the commission to fix prices. Five weeks later five members of the Executive Committee of the association and two other men were indicted at New York for conspiracy in restraint of trade, as above indicated. In late November an agreement was reached between the manufacturers who controlled nine-tenths of the newspaper of the country and the government in the Federal District Court whereby the five members of the Executive Committee entered a plea of *nolo contendere* and agreed to a decree finding the association an unlawful combination. Four of these defendants were fined \$4500 and another \$1000. An extensive agreement was entered into for the regulation of prices of various grades and sizes and a plan for the readjustment of prices for many months in the future was worked out. The Federal Trade Commission was constituted the price-fixing authority. Discontent, however, still manifested itself as was shown by subsequent attacks upon the Newspaper Manufacturers Association in Congress and the allegation that illegal profits of millions of dollars were still being secured.

**BEEF PACKERS.** The Federal Trade Commission made numerous investigations throughout the year into the handling of articles for which the demand had been unusual in consequence of the war. It made a special recommendation to Congress that large appropriations should be made for thorough investigation of trade in numerous such articles. The commission itself undertook as its most important investigation the alleged conspiracies of the Armour, Swift, and other meat-packing interests centring at Chicago. The agents of the commission were in October, November, and December investigating the activities of the packers in Boston, New York, Philadelphia, Chicago, Kansas City, St. Louis, and other important cities. Mr. Francis J. Heney, a well-known attorney of San Francisco, was the special counsel of the commission in charge of this investigation. He alleged that the packers had secured a monopoly of the Chicago stockyards and other terminal facilities in western cities thus making themselves a buyers' monopoly of live stock; they had monopolized the shipping facilities of fresh meat; they also exerted extensive control over the handling of fruits, vegetables, and dairy products, and were thus in a central position as regards the control of much of the nation's food supplies.

**COLGATE AND COMPANY.** An interesting proceeding was the indictment in December at Norfolk, Va., of Colgate and Company, manufacturers of perfumery, soap, and toilet preparations. The ground of the indictment was that this company required dealers, both wholesale and retail, to handle its products at fixed prices, and refused to sell to dealers not carrying out this plan of distribution. The Department of Justice offered the company the alternative of abandoning this plan or being subject to prosecution under the anti-trust law. The company did not deny the practice, but admitted that it had pursued this policy for forty years, that it believed the policy fair to

dealers and the public, and was prepared to carry the matter to the highest court.

**TUBERCULIN.** Moro's technic of administering tuberculin has been reviewed by Blumenau. He applied the method, slightly modified, in seventy children. The most effectual technic was to apply a drop of pure tuberculin to the forearm and then shave off a small piece of epidermis with a razor, cutting through the drop of tuberculin. The skin and tuberculin formed a thin salve on the back of the razor, and this mixture was rubbed into the skin until dry. The dose was gradually increased to four drops at intervals of five days. The results in cases of well-defined tuberculosis in the lungs were negative, but in incipient or occult tuberculosis the therapeutic results were prompt and striking. Blumenau believes that particularly in children certain subjective symptoms are due to infection by tubercle bacilli and occur before tuberculosis is really manifest.

**TUBERCULOSIS.** There is noted among sanitarians an alarming increase in deaths from pulmonary tuberculosis in the various belligerent countries concerned in the European War, not so much among the soldiers as among the civil population. The factors at work are poverty, worry, malnutrition, overcrowding, and overstrain, both physical and mental, even in communities where high wages, paid to workers in munition factories and other war industries, have brought a relatively high degree of prosperity to the civil population. Long hours, monotonous work, and chronic physical weariness have an influence on raising both the morbidity and mortality. In Great Britain it has been particularly noticed that girls between fifteen and twenty years old who are nobly filling the gaps caused by the absence of men at the front, have suffered very heavily from tuberculosis.

To France a special mission has been sent by the Rockefeller Foundation to organize a campaign against the spread of "the white plague," and it is planned to establish in Paris and several large provincial towns completely equipped organizations consisting of dispensaries, clinics, and laboratories. Another part of the mission's work will be the affording of assistance; and a third section will be publicity, providing traveling exhibitions, meetings, and other means of distributing knowledge to the public. Endeavors to perfect the complement fixation test for tuberculosis were continued during 1917, although results obtained differ considerably, due probably to the fact that the antigens used by different laboratory workers have been prepared by widely divergent methods. The first issue of a new monthly publication to be known as the *American Review of Tuberculosis*, appeared in 1917. It is to be the organ of the National Association for the Study and Prevention of Tuberculosis. Dr. Edward R. Baldwin, of Saranac Lake, N. Y., is the editor-in-chief, and Dr. Allen K. Krause, of Baltimore, is the managing editor.

**TUBERCULOSIS IN ANIMALS.** See VETERINARY MEDICINE.

**TUFTS COLLEGE.** A non-sectarian institution of learning, co-educational in some of its departments, at Medford, Mass. In the fall of 1917 there were 1645 students and 309 members of the faculty. The library contained 75,000 bound volumes and 67,000 pamphlets. Pro-

ductive funds in 1917 amounted to \$1,588,084 and the income to \$78,726. During the year \$48,886 in gifts were received. The college was founded in 1852. President, Hermon Carey Bumpus, Ph.D.

**TULANE UNIVERSITY.** A non-sectarian institution for the education of men at New Orleans, La. In the fall of 1917 there were 2727 students enrolled in all departments and 314 members of the faculty. Volumes in the library numbered 72,481. Productive funds amounted to \$4,174,778 and the income therefrom to \$219,719. During the year about \$40,000 was received in gifts. A two-year course preliminary to the study of medicine went into effect at the opening of the fall 1917 session at the completion of which and the first two years in the medical school, students will be granted the degree of bachelor of science. Since the opening of the war classes have been organized in marine engineering, radio-telegraphy, conversational French, and naval architecture. The university was founded in 1834. President, Robert Sharp, Ph.D.

**TUNGSTEN.** See CHEMISTRY, INDUSTRIAL, *Metals*.

**TUNIS.** A French protectorate in North Africa lying between Algeria and Tripoli. Capital, Tunis, with 164,608 inhabitants. Total area, 167,400 square kilometres (64,600 square miles); population, 1,706,830 indigenous Arabs, Berbers, Moors, etc., 49,245 Jews, and about 149,000 Europeans. Population figures are estimates.

By the treaty of 1881, French control over Tunis is to obtain until the local government is declared by both sides entirely capable of orderly administration. A French resident-general governs the country under the direction of the foreign office. The reigning bey receives an annuity of 940,000 francs; in addition, 750,000 francs are granted to the royal princes.

**TUNNELS.** During 1917, the first subaqueous soft-ground tunnel built of segmental concrete blocks was completed at Cleveland, Ohio. This work was of interest as showing that a radically new form of tunnel construction was feasible and that the tunnel builder had at his disposal a new resource for future construction. In fact, in the discussion of the proposed large size tubes for vehicular traffic under the Hudson River at New York, this same form of construction was recommended by a prominent engineer, in what was likely to be one of the most remarkable and difficult river tunnel projects ever to be attempted.

Tunnel construction about New York by 1917 had become almost commonplace in view of the rapid transit development around that city. Nevertheless, four shield tunnels at New York were driven through the hazardous river-bottom soil with complete success, and the entire work was regarded almost in the nature of routine construction. It was but a few years previously that work of this kind would have suggested such dangers and difficulties that overcoming them would have been considered an extraordinary achievement in engineering.

In 1917 the prospects of a vehicular tunnel under the Hudson River were considerably brighter, inasmuch as by that time the counties of Essex, Hudson, and Bergen had made appropriations towards the establishment of a permanent New Jersey Bridge and Tunnel Commission to act in conjunction with a similar commission

in New York State. Accordingly, it seemed certain that the question of intimate connection between these two States would receive a comprehensive and minute study, although in view of the war and the financial situation it was extremely doubtful as to what definite measures would be taken. A notable plan for such a tunnel was proposed by a board of engineers consisting of Professor William H. Burr, Ralph Modjeski, and Daniel E. Moran and submitted on January 30 to the Public Service Commission.

The New York Harbor Board of Engineers set 50 ft. below mean low water between the pier headlines as the minimum depth, and the sectional method of tunnel building, as followed in the construction of the Detroit tunnel and under the Harlem River on the New York subway, was adopted as a system more economical than the shield method. Various elements of the construction were considered in the preparation of the report, and the difficulties were believed to be in no way insurmountable.

An interesting development in tunnel construction was noted in the construction of the Wilson Avenue water-intake tunnel at Chicago. This tunnel was of notable length, namely, eight miles, with three miles under the lake, and was in solid rock. The use of rock derived from the tunnel in making the concrete with which the tunnel was lined was a distinct innovation, and it was found that portable rock screens and pneumatic mixers could be used for this work. The excavated rock was a good limestone which was screened and the rejected portion placed on a car and hauled out of the tunnel. A pneumatic mixer with air tanks and measuring hopper was employed and the whole outfit was mounted on narrow gauge tracks. A considerable saving of time was secured, and it was found that the concrete work could be carried on much faster than the excavation.

On June 20, the last of the East River tunnels under construction in New York City was completed and the final blast fired by the chairman of the Public Service Commission. See RAPID TRANSIT.

A Japanese Corporation was being organized during the year with a capital of \$7,228,250 for the purpose of constructing the railway tunnel under the Mogi Straits, starting at Shimonoseki and ending at Dairi, Fukuoka Prefecture. This tunnel would connect with the main trunk line of Kiushu. The total length was estimated at 17,700 feet, of which 4000 feet would be beneath the sea. The time of construction for the entire project was estimated at five years.

**TURBINES.** See STEAM TURBINES.

**TURKEY,** or the OTTOMAN EMPIRE. A monarchy in southeastern Europe and southwestern Asia, theoretically governed by Mohammed V, the self-indulgent, degenerate sultan with epileptic tendencies. Actually, Turkey's alliance with the Central Powers has made her the creature of Germany, who has wielded her powers, officered her army, directed her policies, and made use of her brutalities in the interests of the Imperial German Empire. Capital, Constantinople.

**AREA AND POPULATION.** Out of the former European area of 169,300 square kilometres, or 65,367 square miles, carrying a population es-

timated at 6,130,200, Turkey retains only 26,100 square kilometres, or 10,882 square miles, with 1,891,000 inhabitants (Constantinople vilayet, 1505 square miles, and 1,203,000 inhabitants; Chatalja mutessarifat, 733 and 78,000; Adrianople vilayet, 8644 and 610,000). Mohammedans preponderate in this territory. The city of Constantinople has 942,900 (with suburbs 1,200,000) inhabitants; Adrianople has 123,000. The great divisions with their area and estimated population are shown in the table below, with density per square kilometre:

	Sq. Km.	Pop.	D.
European Turkey .....	26,100	1,891,000	72
Asia Minor .....	501,400	9,089,200	21
Armenia and Kurdistan....	186,500	2,470,900	18
Syria and Mesopotamia....	637,800	4,288,600	8
Arabia .....	441,100	1,050,000	8

Albania, lost to Turkey at the end of the Balkan Wars, is a name given to an indeterminate area embracing the old vilayets of Scutari and Janina, with portions of Kossovo and Monastir; Macedonia comprehends the old vilayet of Saloniki, the eastern (and larger) part of Monastir, and southeastern Kossovo.

Anatolia is almost identical with Asia Minor. The Armenian Christian population in this region numbered normally 650,000 but the 1915-16 systematic policy of massacres *en masse* has practically wiped them out. Mohammedans predominate elsewhere.

The American Committee for Armenian and Syrian Relief, through its secretary, C. V. Vickrey, gave out a cablegram, February 23, 1917, received from Lord Balfour, which said in part: "Of the 1,800,000 Armenians who were in the Ottoman Empire two years ago, 1,200,000 have been either massacred or deported. Those who were massacred died under abominable tortures, but they escaped the longer agonies of the deported. Men, women, and children were driven from their homes and made to march as long as their strength lasted or until those who drove them drowned or massacred them in batches. Some died of exhaustion, some survived a journey of three months and reached the deserts and swamps along the Middle Euphrates. There they have been abandoned and are dying of starvation, disease, and exposure. A recent report tells of a group of survivors at Abu Herrera, mostly women, children, and a few old men, who had been without food for seven days. Some few, less than a tenth of the Armenians who were in the Ottoman Empire in April, 1915, fled across the frontier to Caucasasia or Egypt. This bare recital of facts reveals the hideous cruelty of which they have been the victims." See RELIEF FOR WAR VICTIMS.

The Hejaz (250,000 square kilometres, 300,000 inhabitants), a province in Arabia, revolted in 1916 against the Turks and declared itself an independent kingdom under the Grand Sherif (Hussein) of Mecca. Turkish rule in other parts of Arabia, always resented, is weakening with the progress of the war. The mutessarifat of Jerusalem (captured by the British in 1917) covers 17,100 square kilometres, with 341,600 inhabitants.

Principal cities, with population, are given in the 1916 YEAR BOOK, where a sketch of the country's natural resources will also be found.

**THE BAGDAD RAILWAY.** In a lecture before the Lowell Institute, the English traveler, H. C. Woods, F.R.G.S., says: "The Bagdad Railroad may be called the backbone of German power in Asiatic Turkey. Constructed as a prolongation of the Anatolian railways, which were opened as far as Konia in 1896, the Bagdad Railroad has been gradually constructed, as the result of a concession given to Germany in 1903. At the present time it is possible to start from Constantinople and travel by train right across the table land of Asia Minor, through the Taurus Mountains, along the plains of Cilicia, through the Amanus range across the Euphrates and at last as far as Helif.

This place lies about two-thirds of the way between the Euphrates and the Tigris. There the facilities for travel have only been available for the last few months, for, while the Amanus tunnel was completed in 1915, the Taurus tunnels were pierced only last year. These additional travel facilities are most important as far as Mesopotamia is concerned, for there are now at most only 200 miles of distance which cannot be traveled either by train or by boats floated down the Tigris from Mosul.

"In regard to Syria these travel facilities are most important, for the great southern arm of the Bagdad Railroad leaves it near Aleppo and runs in a southerly direction through Damascus as far as a point called Deraia Junction. From this point the Hejaz Railroad continues south on the east of the River Jordan as far as Medina. The other line turns from Deraia first in a westward direction and then southward, passing between Jaffa and Jerusalem, and going as far as the Egyptian-Turko frontier."

**NAVY.** A German admiral (von Souchon) controls the navy theoretically under supervision of Djemal Pasha, whose permission, however, he easily disposed with when he sailed away with the Turkish fleet to the Black Sea to bombard Russian ports. He came first into Turkish waters with the third-class German cruiser *Breslau* and the big German battle cruiser *Goeben*. The *Goeben* was launched in 1911. was of 22,640 tons, 610 feet long, 96½ feet beam, and had a speed of 28½ knots an hour. She carried, when in the German navy, ten 11-inch guns, twelve 5.9-inch guns, twelve of 3.4 inches, and had four torpedo tubes. Her full complement numbered 1025 men. The *Breslau*, launched in the same year, was of 4550 tons, with a complement of 373 men. She was 440 feet long and 43 feet beam and could make 24½ knots an hour. She was armed with twelve 4.1-inch guns and had two torpedo tubes.

They arrived at Constantinople in August, 1914. Protests were made by Great Britain, and Turkey replied that the cruisers would be interned. Soon, however, the Turks began to justify their harboring of the warships on the grounds that the British had taken over two Turkish vessels which were being built in England. Later it was announced that Turkey had purchased the cruisers and renamed them the *Sultan Yavaz Selim* (*Goeben*) and the *Medillieh* (*Breslau*). In an encounter at the entrance to the Dardanelles after the close of the year, the British sank the *Breslau* and the *Goeben* escaped but was beached; and British aircraft continued to bombard her.

**COMMERCE.** A table of Turkish trade for two

years follows, value in thousands of pounds Turkish:

	<i>Imports</i>		<i>Exports</i>	
	<i>1911-12</i>	<i>1913-14</i>	<i>1911-12</i>	<i>1913-14</i>
United Kingdom ..	9,946	8,129	5,977	4,660
Austria-Hungary ..	6,889	6,147	3,461	2,281
France .....	3,939	3,592	4,684	4,289
Germany .....	5,163	4,689	1,514	1,227
Russia .....	3,041	3,517	949	831
Bulgaria .....	1,462	270	684	251
Rumania .....	1,229	1,937	607	227
Greece .....	285	137	489	244
Italy .....	2,457	2,699	554	927
Netherlands .....	816	623	418	389
Egypt .....	997	1,431	1,697	1,943
United States .....	1,226	1,080	1,525	1,879
Total.....	45,009	40,810	24,719	21,486

**FINANCE.** In pounds Turkish are shown below estimates for revenue and expenditure for comparative years:

	<i>1915-16</i>	<i>1916-17</i>	<i>1917-18</i>
Revenue .....	25,996,010	22,961,680	25,584,155
Expenditure ...	35,857,540	62,039,236	53,014,551

The net revenue in 1913-14 available for the service of the debt was £15,382,472, compared with £14,536,605 in 1912-13. The condition of the Turkish debt was as follows in April, 1914: Secured on Egyptian tribute, £17,981,106; unified and lottery bonds secured on ceded revenues, £147,936,721; other funded debt (including 1914 loan of £122,000,000), £185,738,180; total, £151,656,007.

Of the total debt, France holds 62 per cent and Germany 29 per cent. The amount borrowed by Turkey from the reestablishment of the Constitution down to the present date is £155,488,326, of which £147,540,012 was required to meet deficits (due to pre-constitutional borrowing) and £7,948,304 for railways. Since the beginning of the war Turkey has received advances from the Central Powers amounting to £179,000,000 repayable not later than eleven years after the war. The total war expenditure of Turkey to March 31, 1917, is placed at £1132,000,000.

**GOVERNMENT.** The sultan Mohammed V was proclaimed April 27, 1909. The heir-apparent, Yussuf Izzedin (born 1857), an opponent both of Enver Pasha and of the Imperial German government, was either murdered or forced to commit suicide, in the year 1917. The cabinet appointed, February 5, 1917, was as follows: Grand Vizier and Minister of the Interior, Talaat Pasha, Pan-Turk; Foreign Affairs, Ahmed Nessim Bey; Justice and President of the Council of State, Halil Bey; War, General of Brigade, Enver Pasha, darling of the Young Turks and of the German militarists, son of an obscure employee of the Roads and Bridges Board and of a "layer-out" of corpses in Stamboul; Marine, Djemal Pasha, bitter enemy of Enver Pasha, secretly anti-German, author of the Syrian massacres, grandson of the official hangman in the service of the sultan Mahmud; Public Instruction and Minister of Posts and Telegraphs, Shukri Bey; Finance, Djavad Bey; Public Works, Ali Munif Bey; Mines, Forests, Agriculture, and Commerce, Sherif Bey; Sheikh-ul-Islam, and Minister of Pious Foundations, Mussa Kiazim Effendi.

**HISTORY.** Few authentic details of the internal history of Turkey during the year were

available. As to Turkey's part in the war, see **WAR OF THE NATIONS.** The following account of the new Pan-Turanian movement in Turkey appeared in the press, and it was to have been hastened by the Russian revolution: The movement originated on the banks of the Volga and its earliest promoter was a Tartar named Aktchoura Oghlou, who in 1904 belonged to the party known as Cadets and chose Kazan for his field of action. The Turanian family in Russia, according to the census of 1907, was represented by 17,669,000 persons, of whom 13,601,000 were Moslems speaking Turkish dialects. Their number was said to have increased since then to twenty millions. Their aim was to bring about the absorption of this Turkish mass of people in the Turkish Empire. The territory that they desired was a strip along the banks of the Volga. To further this end a powerful society was founded at Constantinople. After the Turkish revolution Oghlou was permitted to found two organs to propagate the movement. The association spread from Constantinople into Thrace, Macedonia, the Caucasus, and even Turkestan. It absorbed those elements which especially aimed at nationalizing Turkey, including high officers in the government and in the military and naval services. None but Turks bearing Turanian names were permitted to join it. A Turk who bore the name of another racial stock was obliged to change it in order to become a member. It received a considerable sum from the government in subsidies. From the beginning of the war this society, known under the name of the "Turkish Hearth" (Turk-Ogdaghi), endeavored to extend its influence throughout the whole national life in matters social and intellectual as well as religious and political. It established four sections: (1) A group concerned especially in linguistics; (2) a group for the discussion of historical and scientific matters; (3) a group whose aims were political, and (4) the so-called "Turkish Force," which gave its attention to physical education. There had already existed for a long time a Turkish school which sought to free itself from the Perso-Arabic tradition. This developed to such a point that its principles became practically dogmas and its opponents were treated as traitors and threatened with death. The grammar and style of writing were altered, the old Turkish Tartar vocabulary was restored and the language took on its primitive character. Thus, by drawing together the various dialects still existing or obsolete, a new literary language was created to serve as a bond of union among the people that should constitute the future Turanian confederation. Similar measures were taken in the domain of manners and customs. Old forms of dress were revived. So also were old songs, the national comedy, and old names. At the military schools the young officers began to study the tactical methods of the Mongols. Many clubs were opened where women came three times a week to learn of the national education which should bring in a new generation. As a sign of this nationalism the Pan-Turanians went so far as to take as their drink the ancient "kumys" or fermented mare's milk which had been the beverage of the Asiatic steppes. In short the movement tended to a complete concentration of a new, well-fused national political body on the basis of common race and common

tongue and to route out by fire and sword anything that impaired this unity.

**TUSKEGEE NORMAL AND INDUSTRIAL INSTITUTE.** A non-sectarian co-educational institution for negroes, located at Tuskegee, Ala. In the fall of 1917 there were about 1600 students and 200 members of the faculty. Volumes in the library numbered 24,894. Productive funds in 1917 amounted to \$2,312,149 and the income therefrom to \$111,060. The institute was founded in 1881. President, Robert Russa Moton, LL.D.

**TYLOR, Sir EDWARD BURNETT.** The dean of English anthropologists, died January 2, 1917. He was born in London, October 2, 1832, and was educated at Grove House School, Tottenham. After traveling a year in the United States he went to Mexico in 1856 with Henry Christy and in 1859 published his observations in *Anahuac, or Mexico and the Mexicans*, notable for accuracy of description. In 1865 his *Researches into the Early History of Mankind* was published; in 1871 appeared his *Primitive Culture*, in 1881 *Anthropology*, and in 1900 *The Natural History of Religion*. Anthropological science is greatly indebted to these researches. Tylor's most important scientific contribution was his treatment and development of the doctrine of animism as the fundamental and universal factor in primitive religions. From 1896 until his retirement he was the first professor of anthropology at Oxford University. In 1912 he was knighted.

**TYPHOID FEVER.** The *Journal of the American Medical Association* presented its fifth annual survey of typhoid fever conditions in sixty cities having a population of over 100,000. With the exception of a few cities which suffered from epidemics during 1916, due to infected water, milk, or food, there is a general improvement in the situation over previous years and commendable activity on the part of health authorities in those communities having a high death rate to find the cause and remedy. Cambridge, Mass., heads the list with the remarkably low rate of 0.9 per 100,000, while Birmingham, Ala., brings up the rear with a rate of 42.6 per 100,000. The cities, as heretofore, are divided into five groups according to their population. The first group comprises nine cities with a population of over half a million. The mortality per 100,000 was as follows: Boston, 3.5; New York, 3.8; Chicago, 5.2; Cleveland, 5.3; Philadelphia, 7.8; Pittsburgh, 8.6; St. Louis, 9.4; Detroit, 15.0; Baltimore, 18.0. The number of deaths in this group was 854 in a total population of 13,743,746. Group 2, comprising cities having a population of between 300,000 and 500,000, had a death rate as follows: Seattle, 3.0; Los Angeles, 3.1; Cincinnati, 3.4; San Francisco, 3.4; Newark, N. J., 5.3; Minneapolis, 5.8; Buffalo, 10.9; Washington, D. C., 12.6; Milwaukee, 14.9; New Orleans, 23.4. The number of deaths was 344 in a total population of 4,053,281. The relatively high mortality in Milwaukee was thought to be due to ineffective chlorination of the water supply or to the addition of sodium thiosulphate to neutralize the taste of the chlorin in the water. Group 3 includes cities with a population of from 200,000 to 300,000 and shows the following mortality rate: Portland, Ore., 4.6; St. Paul, 4.9; Providence, R. I., 5.1; Rochester, N. Y., 5.1; Jersey City, N. J., 6.8; Den-

ver, 7.2; Louisville, Ky., 9.7; Kansas City, Mo., 10.6; Columbus, Ohio, 13.4; Indianapolis, 26.6. These cities had a population in 1916 of 2,635,983 and the total number of deaths was 248. Group 4, comprising cities with a population of 125,000 to 200,000 shows mortality rates as follows: Paterson, N. J., 1.4; Spokane, Wash., 2.0; Worcester, Mass., 3.7; Oakland, Cal., 4.0; Omaha, 5.1; Scranton, Pa., 5.4; New Haven, Conn., 8.0; Fall River, Mass., 10.9; Syracuse, N. Y., 12.2; Atlanta, Ga., 17.9; Toledo, Ohio, 22.9; Richmond, Va., 24.1; Memphis, Tenn., 36.3; Birmingham, Ala., 42.6. The total population was 2,250,991, the number of deaths, 330. Group 5, comprising cities having a population of 100,000 to 125,000, gives the following: Cambridge, Mass., 0.9; Tacoma, Wash., 3.5; New Bedford, Mass., 4.2; Springfield, Mass., 4.7; Trenton, N. J., 6.3; Hartford, Conn., 6.3; Albany, N. Y., 7.7; Bridgeport, Conn., 9.0; Salt Lake City, 10.2; Camden, N. J., 11.3; Lowell, Mass., 11.4; Dayton, Ohio, 14.7; Grand Rapids, Mich., 15.6; San Antonio, Texas, 16.9; Reading, Pa., 18.7; Nashville, Tenn., 27.3; Dallas, Texas, 27.5. Total population, 1,983,918; number of deaths, 295.

Classification of the above communities according to their mortality rate shows that there were 16 cities with a rate below 5 per 100,000; 19 cities with a rate between 5 and 10 per 100,000; 17 with a rate between 10 and 20; and 8 with a rate of over 20 per 100,000.

**TYPHUS FEVER.** The occurrence of this scourge among the troops engaged in the European War has served to focus a great deal of scientific attention upon it. The disease has been studied in Serbia, Bulgaria, Austria, and Russia and also in Mexico, Algeria, and Morocco. The intimate association of the bacillus, discovered by Plotz and named by him *B. typhimurantium*, appears to be clearly established, but there are certain points in regard to the disease that have not yet been cleared up, particularly in the line of prophylaxis, by administering serums and vaccines.

Prowazek and several other German observers have recently described certain minute bodies in the digestive tract of lice which have bitten typhus patients. These bodies are described as reddish, short, elliptic, and coccus-like, sometimes showing polar staining. Ricketts and Wilder in 1910 discovered similar polar staining bodies in infected lice while studying Mexican typhus (Tabardillo), and they have been named by Rocha-Lima. *Rickettsia prowazeki*. These organisms are found most plentifully in lice biting typhus patients during the height of the febrile attack. Toepper and Schussler found that there was a rich development of *Rickettsia* in lice biting typhus fever patients. Rocha-Lima found only a superficial resemblance between them and the Plotz bacillus, but Raehr and Plotz appear to regard the two bodies as identical. Preventive vaccination, with the serum prepared by Plotz and administered in various institutions in the Balkans during the winter of 1915 and 1916, appears to have given more than satisfactory results.

**TYROL.** A variant of Tirol (q.v.).

**UGANDA PROTECTORATE.** A British protectorate in East Africa. The area cannot be stated with accuracy; up to the fifth parallel of north latitude, it is estimated at 121,437 square miles, including 16,377 square miles of

water. The protectorate is divided into five provinces—Rudolph, Eastern, Northern, Western, and Buganda. The population, as estimated March 31, 1914, was 2,909,122; March 31, 1915, 2,927,494, consisting of 2,923,031 natives, 2560 Asiatics, and 903 Europeans.

**UKRAINE. EXTENT AND POPULATION.** The Ukrainians, who are also known as Malorussians, Little Russians, and Ruthenians, belong to the western Slavic group of nations. Their chief seat is in the Russian provinces of Podolia, Volhynia, Kiev, Poltava, Chernygov, Ekaterinoslav, and Kharkov, and parts of the adjoining provinces. The Ukrainian ethnographic area also includes the adjacent Austro-Hungarian territory, viz., East Galicia, the north-west of Bukowina, and a portion of Hungary along the slope of the Carpathian Mountains, from Marmaros to Zips. Their number is estimated as thirty million in Russia, upwards of three million in Austria-Hungary, and about one million in other countries. The Ukrainians in Russia are of Greek Orthodox faith, and those in Galicia are mostly Uniates. Notwithstanding local variations, the Ukrainians are easily distinguished from the Great Russians (or Russians proper) by their taller stature, broader and shorter heads, and darker complexion. They grow no beards as do the Russians. Livelier, gayer, and gentler than the latter, the Ukrainians are noted for their poetical and musical gifts. The Ukrainian peasant is said to be more self-reliant than the Russian.

**EVENTS OF 1917.** The dethronement of Czar Nicholas II (see *RUSSIA, History*) brought about a general upheaval, and numerous meetings and local congresses were held in the spring of 1917 in preparation for a general assembly at Kiev to be made up of representatives of all classes and interests. In April this Congress (Rada) demanded autonomy for Ukraine and proposed the establishment of a democratic republic. Many Ukrainian regiments were created, which declared their willingness to support the new government, and the plans for the organization of the Ukrainian republic took shape rapidly. They included a separate cabinet with distinct ministries of war and external affairs, and this gave alarm to the Russian provisional government (the Lvov Cabinet), which sent two Ukrainian members, Messrs. Terestchenko and Tseretelli, to Kiev for investigation and report. On July 15 they presented before the Russian cabinet what amounted to an ultimatum: Russia was to recognize complete autonomy for Ukraine, or total separation would ensue. This brought about the resignation of several Constitutional Democrats in the Russian cabinet. While objecting to full Ukrainian autonomy on the ground that it would seriously injure the campaign against the Central Powers, the provisional government accepted the principle of autonomy, and favored the attaching of Ukrainian delegates to the Russian war ministry and the military staffs. But the carrying out of the terms of this proposal was fraught with new difficulties, the Ukrainians being apprehensive lest they lose control of their troops, while their territorial demands seemed excessive to the provisional government of Russia. It was proposed that the purely Ukrainian provinces (Kiev, Volhynia, Poltava, Podolia, and part of Chernygov) come under the immediate super-

vision of the Ukrainian secretariat general, the disputed provinces to declare their own preference. In August the secretariat general or Ukrainian cabinet included the following members: Premier and Secretary of Internal Affairs Doroshenko; Secretary of Justice, Vinichenko, who later headed the cabinet; Steshenko (Education); Savchenko-Vilski (Agriculture); Veselovski (Trades and Industry); Tugan-Baranovski (Finance); Zarubin (National Affairs), with Associate Secretaries Mickiewicz for Polish, Silberfarb for Jewish, and Shulgin for Ukrainian Affairs.

In addition to military and economic difficulties which confronted Russia as a whole, the Ukrainian government had to reckon with the Russian government, on which it was dependent for financial support, and was hard pressed on the east by the Cossack armies of General Kaledin (see *RUSSIA*). In November the Rada was reported to have sent an army against this enemy. The principles of the Bolshevik party, which by this time had assumed control of the Russian government, did not find favor with the Ukrainian nationalists, nor with the peasants who looked to their government for a solution of the land problem. (There are few industrial workers in Ukraine.) The Bolsheviks having refused to advance money to Ukraine, the latter retaliated by an embargo on foodstuffs destined for northern Russia, and began to issue its own notes. There followed massing of troops on both sides and clashes in Odessa and elsewhere in the latter half of December. Towards Christmas, after an exchange of ultimatums, the Ukrainian government announced the capture of the staff headquarters of the fourth, eighth, and eleventh (Russian) armies on the Rumanian front, and disarming of Bolshevik forces. Cessation of hostilities was urged by the Bolsheviks, who feared an alliance between the Kaledin and Ukrainian forces. The Ukrainian demands included full recognition of a Ukrainian republic, participation in all peace negotiations, military control of the Ukrainian, southwestern, and Rumanian fronts, and guarantee of payment for foodstuffs. See *RUSSIA; WAR OF THE NATIONS*.

**ULTRA-VIOLET RAYS TREATMENT.** See *WATER-WORKS AND WATER PURIFICATION*.

**ULUGH BEG, CATALOGUE OF STARS BY.** See *CARNEGIE INSTITUTION OF WASHINGTON*.

**UNEMPLOYMENT.** Like its immediate predecessor the year 1917 was notable for the almost complete absence of extended unemployment. On the contrary, there were in the United States, as in other belligerent countries, repeated reports of a scarcity of labor. This was due both to the drafting of millions of men for military service and also to the intense energy of industrial activity (see *FINANCIAL REVIEW; and LABOR*). There was a recruiting of thousands of women to new industrial employments (see *WOMEN IN INDUSTRY*) and a tendency to resort more and more to child labor (q.v.). Even the small agitation existing in the early part of 1916 in behalf of unemployment insurance was lost sight of in 1917 (see *SOCIAL INSURANCE*). The extraordinary industrial problem, however, confronting the United States after its entrance upon active hostilities brought clearly to the foreground the necessity of a more thorough or-

ganization of the machinery for bringing idle labor and empty positions together.

**CONSTITUTIONALITY.** In 1914 through popular initiative the State of Washington enacted an Employment Agency Law. This law declared the system of collecting fees from workers for furnishing them with employment resulted in extortion and imposition and that consequently "it shall be unlawful for any employment agent to demand or receive from any person seeking employment any remuneration or fee whatsoever." Injunction against the enforcement of this law was immediately sought on the ground that it conflicted with the fourteenth amendment protecting property rights. On appeal the case finally reached the Supreme Court of the United States which rendered its decision on June 11, 1917, declaring the law unconstitutional by a vote of 5 to 4. The substance of the majority opinion was that in depriving the employment agencies of all fees such agencies were practically destroyed. "You take my house when you do take the profit that doth sustain my house; you take my life when you do take the means whereby I live." Moreover, Justice McReynolds, who wrote the majority opinion, declared that the employment agency business, far from being dangerous to the public welfare, was useful and commendable; that any abuses connected with them should be hedged about by proper regulations; and that consequently the law was arbitrary and oppressive because it unduly restricted liberty of appellants to engage in a useful business.

Those dissenting were Justices McKenna, Brandeis, Holmes, and Clarke. Justice McKenna declared that the law was a valid exercise of the police power against a demonstrated evil. Justice Brandeis pointed out that if decision were to be based upon established facts it seemed clear that the people of Washington considered the collection of fees by private employment agencies a social injustice and the elimination of such establishments was a constructive measure in dealing with the problem of unemployment. He also pointed out that the law was held constitutional by the Supreme Court of Washington and by the Federal District Court, both of which were presumably familiar with local conditions.

Two-thirds of the States have laws regulating to some extent private employment agencies. In various cases previously such laws have been declared unconstitutional, but the majority of such regulating statutes have been declared constitutional.

**PENNSYLVANIA.** In consequence of the seriousness of unemployment in the winter of 1914-15 the Pennsylvania legislature requested the State Industrial Board to report on the subject of panics and industrial depressions. The report included a recommendation which was actively favored by Governor Brumbaugh that during periods of temporary industrial depression the State increase the employment of labor on public works. This recommendation was enacted into law, and an emergency fund for its application was created and placed in the custody of the Emergency Public Works Commission. The first appropriation was \$50,000. The commission consists of the governor, auditor general, State treasurer, and commissioner of labor and industry.

**THE AMERICAN ASSOCIATION OF PUBLIC EM-**

**PLOYMENT OFFICES** held its fifth annual meeting at Milwaukee in September. The principal item of discussion was the report of a committee appointed in July, 1916, with the Commissioner of Labor, Royal Meeker, as chairman, to formulate plans for the standardization of the records and reports of the employment offices throughout the country. This committee held four sessions and collected data from numerous employment officials including representatives of twelve States and the Federal government. In consequence, great progress was made toward a uniform definition of terms to be used in employment records and toward uniform methods of handling renewals of applications, references to positions, placements, and the qualification of occupations and industries. The above committee at a meeting in Chicago in June passed a resolution recommending to Congress the establishment of a National Bureau of Employment Offices. In harmony with a request of the association the Bureau of Labor Statistics began publication of the proceedings of the annual meetings in Bulletin 220 which reported the 1916 session.

**NATIONAL EXCHANGES.** Favor for a system of national exchanges developed also in other quarters. It was pointed out that the terrible hardships of the winters of 1913-14 and 1914-15 had been too quickly forgotten; that the readjustment of industry at the cessation of the war should be forestalled in part by the development of a system of public employment exchanges covering the entire nation; and that the urgent desirability of utilizing every unit of available labor power within the country in order to secure the highest possible degree of military efficiency required the immediate establishment of such a system.

In consequence of such arguments a bill was introduced in Congress in December to create a Federal Employment Service. This provided for an extension and unification of all labor exchange activities of the government, including those of the post offices, and the establishment of a special bureau in the Department of Labor. The bill also provided that the Federal government would grant financial aid to any State or city equal to the amount spent by them in the maintenance of public employment agencies. It was argued that such a law would mobilize labor for the war, aid the reabsorption of returned soldiers after the war, and stabilize the labor markets of the future.

**PORTLAND.** An investigation by Mr. Glenn R. Johnson of 107 destitute unemployed men picked at random from the unemployed in Portland in 1914-15, as published in the *Journal of Delinquency*, showed that 18 per cent tested below 12 years in mental age, 26 per cent below 13 years, and 42 per cent below 14 years. The investigator believed that fully one-fifth of all were high-grade morons. This was somewhat greater than the percentage of feeble-minded among Portland prostitutes according to the estimates of the vice commission of that city. The number, however, was too small to warrant a broad generalization.

**STATISTICS.** The Bureau of Labor Statistics from reports covering a considerable number of establishments in all fundamental industries showed that there was a decrease in the number of workers employed in car building and repairing, cotton manufacturing, and silk, in June,

1917, as compared with June, 1916. All of these decreases, however, were small. The following industries reported increases in the number employed: iron and steel; automobiles; cotton finishing; hosiery and underwear; woolen; men's ready-made clothing; boots and shoes; cigar making; leather; and the paper industry.

**CANADA.** A petition supported by all the provincial governments, the Senate Labor Committee, the Federal Agricultural Committee, the Social Service Congress, the Imperial Munition Board, the heads of five universities, and numerous boards of trade, builders' exchanges, city councils, school boards, and other public and voluntary agencies in favor of a Dominion system of labor exchanges was placed before the governor-general in August. This petition was supported by recalling the hardships due to unemployment at the beginning of the war; by the recent report of the Ontario Commission on Unemployment showing the distress and demoralization due to unemployment; by the urgency of providing in advance some machinery for locating the more than 300,000 soldiers who would return to civil life at the end of the war; by the necessity of relocating at least 200,000 workers who would be dislocated by the cessation of war equipment industries; and by the desirability of more effective public aid in properly distributing the enlarged immigration expected after the war.

**ENGLAND.** According to *The Labour Gazette*, the percentage of unemployed among trade unions paying unemployed benefits averaged less than one-third of 1 per cent during the first seven months of 1917 as compared with an average of nearly 4 per cent for the 10 years, 1907-16. During August and September the percentage rose sharply, reaching 1.2 per cent at the first of October. The greatest amount of unemployment was in the cotton trade where it was 11.8 per cent among 80,000 employees. On the latter date the percentage of unemployed workers insured under the National Insurance Act of 1911 was 0.6 per cent, or only 13,700 among 2,292,000. Among the work people insured under the Munition Workers' Act of 1916 there were 0.89 per cent unemployed, or less than 12,000 among 1,340,000.

**GERMANY.** The German Department of Labor statistics reported less unemployment in August, 1917, than in August, 1916. In mining and smelting, metal trades, engineering trades, electrical and chemical trades there was even more strenuous industrial activity than in 1916, while in wood-working, textile and clothing trades, and building there was little change.

**NORWAY.** The Department of Labor Statistical Office reported the percentage of unemployment among trade unions aggregating 17,992 members was 0.9 on July 31; this compared with 0.4 for the same date in 1916. The largest percentage was among bricklayers and masons, and bakers in Christiania.

**SWEDEN.** The Department of Social Affairs reported the percentage of unemployed among Swedish trade unions with a total membership of 83,400 to be 6.1 on April 1 and 2.8 on June 1. For certain unions the percentage unemployed was as follows: stone workers, 14.6; bricklayers and masons, 33.4; painters, 30.2; tin plate workers, 11.5; general workers and factory operators, 11.6; and wood workers, 8.6.

**ITALY.** The Italian Department of Labor published in February details of new disbursements being made by the government as subsidies to various organizations providing unemployment benefits. Trade unions, benefit clubs, and co-operative societies giving unemployment benefits to their members are granted subsidies up to a total of \$29,199. Labor exchanges were given grants not exceeding a total of \$5840. Finally a sum of \$97,330 was set aside as subsidies for Italians in enemy countries, with a contingent liability for repayment.

**HOLLAND.** In September, 1916, authority was given for the establishment of a government service for unemployment insurance and public employment offices in Holland. This was organized under the Ministry of Waterways and Forests. The plan contemplated the promotion of unemployment insurance by means of subsidies to unemployment funds and otherwise; the promotion of legislation regulating employment insurance; the subsidizing and organization of labor exchanges, their supervision, and coordination; and the promotion of legislation with reference to employment offices. After January 1, 1917, any approved unemployment funds will receive a subsidy equal in amount to the total contributions of its members, such subsidy to be paid one-half by the crown and one-half by the commune. Such subsidy is contingent in part upon the investment by societies of their unemployment fund in a manner prescribed by the new bureau; the supervision of funds is placed mainly in the hands of communal authority. Any commune may refuse to grant the prescribed subsidy in which case the state also withholds its proportion. A central employment bureau is created; the country is divided into thirty employment zones each with headquarters; all headquarters are connected with a central bureau which will publish a daily bulletin. The expenses of the central bureau may be borne by the state and those of the zone headquarters jointly by the state and communes.

**UNIFLOW ENGINE.** See AUTOMOBILES.

**UNION COLLEGE.** A non-sectarian institution for the education of men, located at Schenectady, N. Y. In the fall of 1917 there were 657 students and 46 members of the faculty. Volumes in the library numbered 50,000. Productive funds in 1917 amounted to \$1,233,032 and the income to \$67,231. The college was founded in 1795. President, Charles Alexander Richmond, LL.D.

**UNITARIANS.** The estimated number of communicants in this denomination in 1917 was over 71,200. There were 517 ministers and 490 churches in the United States and Canada. The American Unitarian Association, whose headquarters are in Boston, is the governing body of this denomination. This denomination is very active in the dissemination of literature, consisting of tracts, books, and periodicals. The association distributes about 400,000 tracts annually together with 45,000 copies of the monthly bulletin, *Word and Work*, 14,000 copies of the *Annual Report*, and 3000 copies of the *Unitarian Year Book*. The various departments of the association are: Finance, publication, publicity, foreign relations, comity and fellowship, religious education, church extension, social and public service, new Americans, ministerial aid, library, and church building loan fund. Uni-

tarianism is also represented in the following countries: Africa, Australia, Great Britain and Ireland, New Zealand, Tasmania, Denmark, Norway, Sweden, Iceland, Japan, Palestine, India, Holland, Switzerland, Belgium, France, Bulgaria, Egypt, Germany, Italy, Jamaica, Russia, China, and Brazil. There are divinity schools at Cambridge, Mass., Meadville, Pa., and Berkeley, Cal. The periodicals are *The Christian Register*; *The Beacon*; *The Unitarian Advance*; *Unity*; *The Pacific Unitarian*; and *Unitarian Word and Work*. The president of the American Unitarian Association is Rev. Samuel A. Eliot, and the secretary, Rev. Louis C. Cornish.

**UNITED BRETHREN IN CHRIST.** This denomination, whose theology is practically the same as the Methodists, had its beginning in 1768, as a result of the evangelical work of Philip William Otterbein, a missionary to the German Reformed Church, who came to America in 1752. The church was not formally organized until 1800. In 1917 the 150th anniversary of its spiritual beginning was celebrated. The church is governed by a general conference, elected every four years, and composed of ministerial and lay delegates elected in equal proportion. On the first of January, 1917, there were 3630 churches; 1988 itinerant preachers, 440 local preachers; 348,585 members; 1844½ young people's societies, with a membership of 77,645; 746 junior and intermediate societies, with a membership of 28,321; 3522½ Sunday schools, with 43,483 teachers and officers and 454,275 scholars. The total church contributions for 1916 were \$3,433,180. The value of the church houses in the same year was \$13,206,561 and the value of the parsonages \$2,307,904. There were 3364 church houses and 1167 parsonages. The denomination maintains educational institutions. The denominational organ is *The Watchword*, of which Rev. H. F. Shupe, Dayton, Ohio, is the editor.

**UNITED KINGDOM.** The United Kingdom of Great Britain and Ireland is treated in this book under the heading GREAT BRITAIN.

**UNITED PRESBYTERIAN CHURCH OF NORTH AMERICA.** The origin of this denomination dates from 1853, and was due to a union of associate and associate reformed churches. The *Presbyterian Handbook* for 1918 states that the total membership of this body in 1917 was 203,928 and the number of Sunday school scholars 193,199. The following figures are for 1916: 13 synods; 75 presbyteries; 1143 ministers; 1143 congregations; 1420 Sunday schools; and 1048 young people's societies with a membership of 36,514. Missions are maintained in India, Egypt, and the Sudan.

**UNITED STATES. POPULATION.** The estimated population of continental United States on July 1, 1917, was 103,635,306. The population on April 15, 1910, the year in which the last census was taken, was 91,972,206. The population of the several States and the territorial possessions will be found in the articles dealing with them.

**AGRICULTURE.** The general statistics for agriculture in 1917 in the United States and its dependencies will be found in the articles dealing with agriculture and agricultural production. In the section on agriculture in each of the State articles is given the acreage, production, and value in 1917. See also the articles on territorial possessions, the respective crops, **AGRICULTURE, AGRICULTURAL LEGISLATION, and the UNITED STATES DEPARTMENT OF AGRICULTURE.**

**MANUFACTURES.** The leading manufactures are dealt with in articles under their own titles, as cotton, rubber, silk, textiles, etc.

**MINERAL PRODUCTION.** The mineral production of the States is given in a paragraph in the State articles. See also the article **MINERAL PRODUCTION.** The following table gives the mineral products of the United States in 1915-16:

MINERAL PRODUCTS OF THE UNITED STATES IN 1915 AND 1916

Product	Quantity	1915 Value	Quantity	1916 Value
<b>METALLIC</b>				
Aluminum .....	.....	\$16,280,000	.....	\$33,900,000

a Not included in total value.

b Canvases discontinued. Value of iron ore sold for paint included under "Unspecified."

c Value included under "Unspecified."

d Includes 59,189 tons in 1915 and 92,802 tons in 1916 of stronger acid, reported as oleum, etc., not converted to 60° Baumé.

e Includes in 1916 antimony other than content of antimonial lead, bismuth, cadmium sulphide, diatomaceous earth for special uses, iron ore sold for paint, lithium minerals, lithographic stone, magnesium, marls, molybdenum, pebbles for grinding, selenium, silica sand and sandstone (finely ground), strontium, sulphur, and an estimate of the value of miscellaneous mineral products not collected annually by the Survey.

**EDUCATION.** For information relating to educational matters, see the articles on **EDUCATION IN THE UNITED STATES**, and **UNIVERSITIES AND COLLEGES**. In most of the State articles will be found short summaries of educational statistics and other matters.

**RELIGION.** For information relating to the various denominations, see the articles on these denominations.

**FOREIGN COMMERCE.** The event of transcending importance to the foreign trade of the United States during the fiscal year 1917 was

its entrance into the war. From the beginning of the war to the time of the entrance of this government into it, the business of American manufacturers and importers was to sell munitions and supplies to the belligerents, to make the most of new opportunities in the markets of non-belligerents, and to take the necessary steps in preparation for trade after the war.

Upon our entrance into the war, however, the situation changed. Trading with the Allies assumed a new and greater significance—it became primarily a means of winning the war, rather

than of winning profits. The attitude of the United States toward the market in non-belligerent countries also, as a matter of course, met with a distinct change. It was now necessary to carry on trade with them with a careful and patriotic difference to the successful prosecution of the war.

The fiscal year 1917 was the greatest year in foreign trade. The total of our transactions with foreign countries was unprecedented in the history of the United States or any other country. Merchandise, exported and imported, was valued at \$8,953,000,000, a notable gain even when compared with the \$6,531,000,000 of the previous year. It more than doubled the highest figure ever recorded in normal times. The chief gain was in exports, which were valued at \$6,293,806,090, as against \$4,333,482,885 in 1916. Before the war the monthly exports averaged about \$200,000,000; in 1915 the average was about \$230,000,000; in 1916, it had risen to \$361,000,000; and in 1917 the average monthly value of exports was \$524,000,000. The greatest month in the history of American export trade was January, 1917, when the sales abroad amounted to \$613,000,000.

The imports also increased in a notable manner in 1917, for the total value of foreign merchandise brought into the country was about \$2,660,000,000, an increase of more than \$460,000,000 over 1916, the former record year. With the exception of England, no country has ever imported merchandise at this rate. In normal times, the imports had averaged about \$150,000,000 a month, but in 1917 the average was raised to \$221,000,000. In June, the closing month of the fiscal year, a total of \$306,000,000 worth of foreign products were brought into the country. The exports exceeded the imports by \$3,634,000,000. This increase in excess of exports amounted to 70 per cent as compared with 1916, and 232 per cent as compared with 1915. The significance of these figures will be better realized if it be borne in mind that the balance of trade in our favor in the twenty years before the war amounted to something less than \$450,000,000 a year.

The most interesting feature of the export trade for 1917 is the great gain in the sales of completed manufactures; \$2,944,000,000 worth of such products were shipped in 1917, as compared with approximately \$2,000,000,000 in 1916 and \$725,000,000 worth in 1915.

By far the largest part of our export trade was with Europe. In 1914, nearly 63 per cent of the exports were sent to that continent, and this increased to over 60 per cent in 1917. Most of our exports, during the last two or three years to Europe have been army supplies and foodstuffs, and it is to be expected that when peace is made, there will be a falling off in the sale of such lines. On the other hand, it is probable that the demand by European countries, especially Belgium, France, and Russia, for building materials, machinery, railroad equipment, and other construction and reconstruction materials, will be larger than it has been during the war.

The total exports to Europe in 1917 amounted to \$1,325,000,000, as compared with \$1,486,000,000 in 1914. Exports to South and Central America, Australia, and the Far East, as well as Africa, show a general increase. The following table shows the total values of exports of

merchandise, by principal countries and grand divisions, during the fiscal years ended June 30, 1916 and 1917.

The imports showed important changes in 1917, compared with former years. For the first time in the history of the country, Europe, which had held first place in selling goods to the United States, declined to second place, while North America took first place. In 1914 the imports from Europe were valued at \$896,000,000, or 47¼ per cent of the total, while imports from North America were valued at \$477,000,000, or 22½ per cent of the total. In 1917 the imports from Europe showed a decrease of \$285,000,000 from the figures of 1914, and the imports from North America showed an increase of \$339,000,000, a gain of 80 per cent for North America, against a loss of 32 per cent for Europe. The imports of German goods decreased \$188,000,000 in 1917 against 1914, amounting to \$190,000,000 in 1914 and \$2,000,000 in 1917. Other decreases shown in the import trade are: Austria-Hungary went from \$20,000,000 to less than \$250,000 in 1917; Belgium from \$41,000,000 in 1914 to \$1,000,000 in 1917;

France from \$141,000,000 in 1914 to \$108,000,000 in 1917; Italy from \$56,000,000 in 1914 to \$46,000,000 in 1917; and Russia from \$21,000,000 in 1914 to \$5,000,000 in 1917.

The following table shows the total values of imports of merchandise into the United States by principal countries and grand divisions during the fiscal years ended June 30, 1916 and 1917:

## VALUES OF IMPORTS, 1916-1917

Countries	1916	1917
<b>EUROPE</b>		
Austria-Hungary .....	\$1,430,935	\$225,452
Belgium .....	1,478,579	1,029,281
France .....	102,077,620	108,069,706
Germany .....	13,945,743	1,524,693
Italy .....	57,432,436	46,874,368

For the calendar year, the foreign trade of the country amounted to over \$9,000,000,000; exports reaching a total of \$6,226,000,000, while the imports amounted to \$2,925,000,000. This is a gain of nearly \$1,300,000,000 over 1916, when the total trade amounted to \$7,874,000,000. The tables following show the chief articles of imports and exports in the fiscal years 1916-17:

## CHIEF ARTICLES OF IMPORT, 1916-1917

Articles	1916	1917
Art work .....	\$20,831,531	\$23,899,966
Chemicals, drugs, and dyes ..	109,106,634	124,770,575
Coffee .....	115,485,970	183,184,000
Copper, and manufactures of .....	52,881,055	93,703,230

Articles	1916	1917
Cotton, and manufactures of .....	47,511,870	56,181,684
Earthen, stone, and china-ware .....	5,837,206	5,989,964
Fibres: .....		
Manufactures of .....	68,444,735	78,955,185
Unmanufactured .....	59,460,062	67,709,758
Fruits, including nuts .....	44,446,307	58,180,957
Furs, and manufactures of ..	16,891,699	4,655,812
Hides and skins and other than fur skins .....	158,861,376	216,363,609
India rubber and gutta percha and crude .....	155,044,790	189,328,674
Iron and steel, and manufactures of .....	28,393,250	27,899,829
Leather, and manufactures of .....	19,019,526	27,393,513
Oils .....	48,091,993	67,677,316
Precious stones .....	45,101,936	47,270,689
Silk: .....		
Manufactures of .....	31,911,856	40,322,840
Unmanufactured .....	124,333,655	160,571,808
Spirits, wines, and malt liquors .....	16,685,356	17,679,132
Sugar .....	208,769,399	230,574,221
Tea .....	20,599,857	19,265,264
Tin, in bars, blocks, or pigs .....	50,876,901	54,996,098
Tobacco, and manufactures of .....	17,872,126	20,182,984
Wood, and manufactures of ..	64,559,815	93,295,052
Wool: .....		
Manufactures of .....	15,657,537	18,862,463
Unmanufactured .....	142,420,734	131,137,170

## CHIEF ARTICLES OF EXPORT, 1916-1917

Articles	1916	1917
Agricultural implements ..	\$17,611,297	\$26,552,826
Animals .....	99,662,813	89,382,954
Automobiles .....	120,000,866	90,958,248
Breadstuffs .....	435,696,629	589,234,737
Chemicals, drugs, dyes, and medicines .....	124,362,167	187,846,351
Coal .....	65,958,275	83,119,288
Copper, and manufactures of .....	173,946,226	820,284,174
Cotton: .....		
Manufactures of .....	112,053,127	136,253,858
Unmanufactured .....	874,186,247	543,100,542
Fertilizers .....	5,843,497	6,971,011
Fish .....	19,983,545	19,875,614
Fruits, including nuts .....	36,965,328	39,394,197
Iron and steel, and manufactures of, not including ore .....	621,209,453	1,129,841,616
Leather, and manufactures of .....	146,613,815	153,711,912
Meat and dairy products ..	291,057,602	404,143,791
Mineral oils .....	166,423,230	223,790,599
Naval stores .....	13,503,607	15,607,311
Oil cake and oil cake meal ..	28,541,304	31,286,840
Paraffin and paraffin wax ..	12,873,250	16,021,811
Paper, and manufactures of ..	29,111,004	43,161,701
Tobacco: .....		
Manufactures of .....	6,944,147	15,552,544
Unmanufactured .....	53,163,595	59,954,239
Vegetable oils .....	27,167,220	26,280,019
Wood, and manufactures of ..	60,707,229	62,817,451

CONDITION OF THE TREASURY. The following table shows the financial condition of the United States treasury on December 31, 1917:

## GENERAL FUND

Assets	
Available gold (see below) .....	\$59,251,972.12
Available silver dollars (see below) ..	16,800,521.00
United States notes .....	8,781,228.00
Federal reserve notes .....	23,577,065.00
Federal reserve bank notes .....	68,240.00
National bank notes .....	14,292,455.58
Certified checks on banks .....	25,151.66
Subsidiary silver coin .....	1,791,849.58
Minor coin .....	625,037.04
Silver bullion (available for subsidiary coinage) .....	7,174,476.60
Unclassified (unsorted currency, etc.) ..	1,202,999.25
Deposits in Federal land banks .....	2,180,000.00
Deposits in Federal Reserve Banks ..	108,467,679.90

<i>Assets</i>	
Deposits in Special Depositaries:	
Account of sales of certificates of indebtedness	251,091,014.99
Liberty Loan deposits	438,420,909.59
Deposits in National Banks:	
To credit of Treasurer, United States	37,745,705.70
To credit of other government officers	8,268,831.82
Deposits in Philippine treasury:	
To credit of Treasurer, United States	1,496,630.92
To credit of other government officers	2,223,544.71
<b>Total</b>	<b>\$982,986,313.46</b>
<i>Liabilities</i>	
Treasurer's checks outstanding	\$7,090,895.90
Deposits of government officers:	
Post Office Department	17,410,354.46
Board of trustees, Postal Savings System (5 per cent reserve)	5,716,950.44
Comptroller of the Currency, agent for creditors of insolvent banks	982,892.81
Postmasters, clerks of courts, etc.	26,169,884.02
Deposits for:	
Redemption of Federal reserve notes (5 per cent fund)	61,063,622.44
Redemption of Federal reserve bank notes (5 per cent fund)	536,700.00
Redemption of national-bank notes (5 per cent fund)	28,094,683.67
Retirement of additional circulating notes, act May 30, 1908	1,566,395.00
Exchanges of currency, coin, etc.	11,291,965.88
	\$159,924,344.12
Net balance	823,061,969.34
<b>Total</b>	<b>\$982,986,313.46</b>

**PUBLIC DEBT.** The total interest bearing debt on December 31, 1917, amounted to \$7,116,032,330; the debt bearing no interest amounted to \$238,503,780, and the debt on which interest has ceased amounted to \$2,841,240, making a total gross debt of \$357,377,351. The balance available at the end of the year to pay maturity obligations amounted to \$1,693,018,254, leaving a total net debt of \$6,864,359,097.

**CIRCULATION STATEMENT.** The following table shows the money in circulation in the United States on December 31, 1917:

## CIRCULATION STATEMENT

<i>Circulating medium</i>	<i>Jan. 1, 1918</i>	<i>Jan. 1, 1917</i>	<i>Dec. 1, 1917</i>	<i>Jan. 1, 1917</i>
Gold coin (including bullion in Treasury)	\$972,561,266.6	\$679,702,890	\$1,065,170,819	\$96,262,850
Gold Certificates	1,096,860,844	1,680,030,029	1,154,911,989	21,189,280
Standard Silver Dollars	77,869,353	72,330,864	76,815,307	5,790,721
Silver Certificates	472,191,576	476,795,618	474,467,405	413,360
Subsidiary Silver	216,434,729	190,171,320	212,602,353	67,982,601
Treasury Notes of 1890	1,908,063	2,035,188	1,912,059	
United States Notes	337,899,788	341,271,554	339,852,125	310,288,511
Federal Reserve Notes	1,227,243,190	298,013,235	1,044,304,181	
Federal Reserve Bank Notes	12,535,925	11,764,495	12,756,885	
National Bank Notes	704,920,174	708,817,446	702,677,229	314,339,396
<b>Total</b>	<b>\$5,120,424,908</b>	<b>\$4,440,932,634</b>	<b>\$5,085,870,352</b>	<b>\$16,266,721</b>
Population of continental United States estimated at	105,006,000	108,287,000	104,863,000	48,231,000
Circulation per capita	\$48.76	\$43.00	\$48.50	\$16.92

<sup>a</sup> Includes \$299,843,787.50 credited to Federal Reserve Banks in the Gold Settlement fund deposited with Treasurer U. S.

**ARMY AND NAVY.** Matters affecting the army and navy during the year are sufficiently covered in the articles, **MILITARY PROGRESS** and **NAVAL PROGRESS, SHIPPING, and the UNITED STATES AND THE WAR.**

**POST OFFICE.** The total revenue of the postal service for the fiscal year ending June 30, 1917, amounted to \$329,726,116, an increase over 1916 of \$17,668,427. The expenditures amounted to

\$319,838,718, an increase over the previous year of \$13,134,685.

The needs of the military establishment have necessitated special provision by the Postal Department for the handling of mail for the American forces at home and abroad. This was brought about speedily and satisfactorily, although it included a specially organized service for camps and cantonments at home, and a new postal service adapted to the needs of the expeditionary forces and for the navy abroad. Upon the declaration of war with Germany, the department took immediate steps to provide for such service. A commission of postal experts studied the extensive British and French army postal service in London and Paris and at the front. The first United States army post office in France was opened shortly after the arrival of the first contingent of troops on the continent. The mail is distributed to companies and other units and delivered daily by railroads and army trucks to the various camps, where it is turned over to the authorized representatives of the army for proper delivery. In the United States it was necessary to provide adequate mail facilities to serve more than 1,000,000 men mobilized at the various cantonments and aviation fields. Such branch offices have been established at military camps in twenty-nine States, and the average volume and importance of business was equal to that of offices in the cities having a population of 200,000.

The parcel post continued to develop throughout the year, and the number of parcels handled increased more than 25,000,000, or 14 per cent over 1916, and the total weight handled exceeded 2,000,000,000 pounds.

The postal savings system showed a remarkable growth during the year, and on June 30, 1917, there were 674,728 depositors in the books of the system with \$131,954,696 to their credit.

The war revenue measure which became a law on October 3, 1917, provided for an increase in the rates of postage on first-class mail and a gradual increase in the rates of second-class matter and established zone rates on that devoted

to advertisements. The maximum rate on advertisements will not be reached until July 1, 1921. A tax was also imposed on parcel post when the postage amounts to twenty-five cents or over. The increase in second-rate postage aroused great opposition among the publishers of magazines and newspapers, and efforts were at once begun to bring about a repeal of that portion of the law in the Sixty-Fifth Congress.

**MAJOR GENERAL PEYTON C. MARCH**

**FOUR PROMINENT OFFICERS OF THE UNITED STATES FORCES**

**PENSIONS.** The amount paid for pensions for the fiscal year 1917 was \$160,895,054. By an act of April 27, 1917, provision was made for a special pension of \$10 per month for life, payable quarter yearly, in addition to any other pension under any existing or subsequent law, to every person over sixty-five years of age, who was placed on the army and navy medal of honor roll. Under this law were entered on the roll 351 names. The amount of payments in 1917 on account of this act was \$41,582.

In the first section of the act of September 8, 1916, the pensions of 157,248 widows were increased from \$12 to \$20 per month. Under the act of March 4, 1917, the Indian War Survivors' Act, 6517 claims had been filed up to June 30, 1917. Up to that date only 11 claims had been filed for service in the war of 1917, but these had been materially increased at the end of the year.

**PATENTS.** The total number of applications for patents in 1917 was 701,620, an increase of 1317 over 1916. The total number of applications awaiting action on June 30, 1917, was 16,058, a decrease of 50. The total number of patents granted in 1917 was 44,179, a decrease of 1954. The total receipts of the office amounted to \$2,317,519, and the total expenditures \$2,095,138.

**BUREAU OF MINES.** The bureau in 1917 co-operated with the Council of National Defense and other national bureaus in work necessary for the successful conduct of the war. It carried on investigations into the fixation of atmospheric nitrogen and oxidation of ammonia to nitric acid, for the purpose of aiding the government to obtain the supply of nitrates for use in agriculture or in the manufacture of explo-

sives. It also investigated noxious gases used in warfare, and developed masks to protect men from such gases. It carried on an investigation in the use of smoke screens in warfare, and the methods best suited to produce such screens. In addition to its work along these lines, the bureau trained 4800 men in mine rescue and first aid methods. On June 30, 1917, the total number of men trained in the organization was 48,873. As a result of the investigation of the bureau into radium, in cooperation with the National Radium Institution, there was acquired \$200,000 worth of radium, which has been used for scientific and medical research.

**DIPLOMATIC SERVICE.** The most important changes in the personnel of the diplomatic service in 1917 resulted from a declaration of war with Germany. As is related in the article, **UNITED STATES AND THE WAR** (q. v.), Ambassador Gerard left Berlin, after some delay, and arrived safely home. Ambassador Bernstorff also was given safe conduct and reached Germany without incident.

The revolution in Russia resulted in the resignation of the Russian Ambassador, George Bakhmeteff, who was out of sympathy with the revolutionists and declined to serve as their representative. He was succeeded by Mr. Boris A. Bakhmetieff as Ambassador representing the revolutionists.

Following the declaration of war with Austria-Hungary, Ambassador Penfield at once returned to the United States. These were the chief changes in the diplomatic personnel during the year. A list of the representatives of the United States to foreign countries and of foreign countries to the United States is given below:

#### AMBASSADORS

Country	Accredited by United States	1914	Accredited to United States	1911
Argentina	F. J. Stimson, Mass.	1913	Rómulo S. Nâon	1911

**CABINET.** There were no changes in the Cabinet during the year. The activities of its members will be found treated in the various articles throughout the YEAR BOOK.

**THE SIXTY-FOURTH CONGRESS, SECOND SESSION.** Congress reassembled after the holiday session on January 2. On the day following, debate in the Senate began on a resolution introduced by Senator Hitchcock of Nebraska, endorsing the action of the president in asking the nations at war to state the terms on which they would discuss peace. Two days later the resolution, amended so as to endorse the president's "request" but not his "action," was passed by a vote of 48 to 17.

The Senate, on January 9, by a vote of 55 to 32, passed the Sheppard Bill prohibiting the manufacture or importation or sale of liquor in the District of Columbia.

The Rules Committee of the House, on January 5, engaged Sherman L. Whipple of Boston to act as counsel in the investigation of the alleged "leak" by which confidential information was said to have reached Wall Street, and influenced the price of stocks. It was charged that advanced information was given in relation to the president's intention to issue a note to the belligerent nations suggesting preliminary steps toward the conclusion of peace. The counsel questioned Thomas W. Lawson, of Boston, who had brought the charges, and several prominent financiers of New York City. It might be stated that the investigation, which was prolonged over several weeks, had no final results.

The Senate, on January 8, adopted the conference report of the Immigration Bill by a vote of 56 to 10. The House, on the following day, passed the Hughes-Smith Vocational Education Bill providing funds for cooperation with the States in the training and paying of teachers and directors of agricultural, commercial, industrial, and domestic science subjects.

On January 10, after a long controversy, the Senate confirmed the reappointment of Winthrop M. Daniels as member of the Interstate Commerce Commission. The appointment was opposed by Senator Cummins of Iowa, who charged Mr. Daniels with having capitalistic sympathies.

On January 2, President Wilson appeared before the Senate and delivered an address on the foreign relations of the United States (see **UNITED STATES AND THE WAR**). Opposition to the president's suggestions at once appeared. Senator Borah introduced a resolution calling upon the Senate to reaffirm the policies "announced by Washington, Jefferson, and Monroe, and ever since adhered to by this country." Senator Cummins of Iowa introduced another resolution calling for the full debate on the president's speech.

On January 31, the note of Germany in relation to the submarine warfare was delivered to the State Department, and on February 3, President Wilson addressed the joint session of the two Houses of Congress. For the full text of this address see the article on **UNITED STATES AND THE WAR**. The president's action in breaking off diplomatic relations with Germany received the support of practically every member of Congress.

On January 29, the president vetoed, for the second time, the Immigration Bill, which was

promptly passed over his veto by the House by a vote of 285 to 106. It was later repassed by the Senate. See **IMMIGRATION AND EMIGRATION**.

The Senate on February 7 passed a resolution by a vote of 78 to 5 approving "the action taken by the president as set forth in his address delivered before the joint session of Congress." The senators voting in the negative were Senator Kirby of Arkansas; Senator Vardaman of Mississippi; Senator Gronna of North Dakota; Senator Works of California; Senator La Follette of Wisconsin. The first two are Democrats and the others Republicans. Party lines were ignored during the debate on the resolution. Senator Lodge of Massachusetts warmly endorsed the action of the president.

Senator La Follette, the leader of the pacifist element in the Senate, introduced a resolution prohibiting the armament of American merchant vessels. The Senate considered the so-called Neutral Laws introduced at the request of the administration. Senator Cummins of Iowa opposed the measure on the ground that the prohibition against the revelation of military secrets, as provided for in the bills, would prevent any public discussion of national unpreparedness. Other Senators criticized the provisions against espionage on the ground that they would endanger the liberty of innocent people who might unwittingly enter a prohibited area.

On February 13, a Naval Appropriation Bill authorizing the expenditure of \$368,000,000, passed the House by a vote of 354 to 22. The chief opponents of the bill were Democrats. The sub-committee of the Senate Naval Affairs Committee agreed to add to the House bill many appropriations, including a lump sum of \$150,000,000 to expedite construction and to meet any emergency which might arise before Congress would again meet to vote the necessary funds.

The Senate, on February 6, passed the Post Office Appropriation Bill carrying over \$330,000,000. The bill contains a provision barring from the mails all letters, postal cards, circulars, newspapers, and publications of every kind, advertising intoxicating drinks, if sent to any address within a State or Territory in which the sale of liquor is prohibited.

In the first week in March, Congress received for consideration the bill for universal military training and service prepared by the general staff of the army. It was sent to Congress without the specific endorsement of the president or the secretary of war. During the last week of the session the progress of the business of Congress was prevented by the action of Republican senators, who wished for an immediate session of the new Congress following the adjournment of the old. The Emergency Revenue Bill was at the time under discussion, and the filibuster began with a debate over the new taxes on excess profits provided for in the bill. After an appeal from the Democratic leaders, the Republican senators finally agreed to permit a vote on the revenue bill. During the filibuster there were many speeches delivered in relation to the war situation. The president was strongly defended by Senator Williams of Mississippi and was criticized by Senator Lodge of Massachusetts.

On February 22, the House approved a measure already passed in the Senate prohibiting the importation of liquor into any State which

prohibited the manufacture and sale of intoxicants.

On February 20 the Senate passed, by a vote of 60 to 10, the Omnibus Bill directed against espionage. Of the 10 senators against the bill, 7 were Republicans and 3 Democrats.

On February 26 President Wilson appeared before the joint session and requested authority to supply merchant ships with defensive arms and "to employ any other instrumentalities or methods that may be necessary and adequate to protect our ships and our people." The full text of this measure will be found in the article **UNITED STATES AND THE WAR**.

Following the action of the president, there was at once introduced into the House a bill covering the power requested by the president, and appropriating one hundred million dollars to be raised by bond issue for arming, insuring, and protecting such ships. A similar bill was introduced into the Senate. The measures were opposed in both Houses, but were passed by the House on March 1 by a vote of 403 to 13. In the Senate the opposition was much more serious. Senator Stone of Missouri, chairman of the Foreign Affairs Committee, and theoretically the spokesman of the president on international affairs, refused to support the bill, and led the fight against it. He was supported in his attitude by a group of Republican senators under the leadership of Senator La Follette of Wisconsin. Although they were unable to defeat the bill, it was within their power to prevent it from coming to a vote by consuming the few remaining hours of the session with speeches. The majority of the senators who favored the bill, finding it impossible to bring it to a vote, signed the following resolution:

"The undersigned United States senators favor the passage of Senate Bill 8322, to authorize the president of the United States to arm American merchant vessels. A similar bill already has passed the House of Representatives by a vote of 403 to 13. Under the rules of the Senate allowing unlimited debate it now appears to be impossible to obtain a vote prior to noon, March 4, 1917, when the session of Congress expires. We desire the statement entered in the record to establish the fact that the Senate favors the legislation and would pass it if a vote could be obtained."

Among the senators who did not sign the resolution were Penrose, La Follette, Norris, Works, Clapp, Gronna, Cummins, Republicans, and Stone, O'Gorman, Kirby, and Vardaman, Democrats. Owing to the fact that the business of Congress was held up by the Republican and pacifist filibuster, many of the tasks undertaken in the session remained unaccomplished. Among these were nearly two thousand confirmations of nominations, the Railroad Labor Bill, and a bill relating to the high cost of foodstuffs. Several important measures, however, were passed in the last week of the session. One of these was the Revenue Bill, which provided for the raising of \$350,000,000 by special taxation and bond issues. Other measures passed were several of the regulation appropriation bills, the measure establishing a form of government for the Danish West Indies, a Flood Control Bill, and a bill granting American citizenship to the natives of Porto Rico. The Naval Appropriation Bill carrying \$550,000,000 also passed both Houses. The Army Bill, how-

ever, remained in the Senate, as it did not reach a vote. On March 4 the president issued a statement on the failure of the Armed Ship Bill, in which he reviewed the situation and declared that "A little group of willful men, representing no opinion but their own, have rendered the great government of the United States helpless and contemptible." The group, according to the press, comprised the following twelve Senators: La Follette, of Wisconsin; Clapp, of Minnesota; Cummins, of Iowa; Gronna, of North Dakota; Kenyon, of Iowa; Norris, of Nebraska; Works, of California; Kirby, of Arkansas; Lane, of Oregon; O'Gorman, of New York; Stone, of Missouri; Vardaman, of Mississippi.

**THE SIXTY-FIFTH CONGRESS, SPECIAL SESSION.** Shortly after the expiration of the Sixty-Fourth Congress, President Wilson issued a call for a special session of the Sixty-Fifth Congress to convene on April 16. In the meantime the Senate continued in special executive session and on March 5 the senators who were elected in November, 1916, took the oath of office. There were 16 new senators and 12 others who had been reelected. The Senate addressed itself to a revision of its rules which would make impossible such a situation as had been created during the last days of the previous session. A committee of six Democrats and five Republicans was appointed to consider the changes to be made. Caucuses of both parties approved a bill providing that at any time sixteen senators by serving a notice in writing upon the presiding officer, may demand a vote as to whether debate should be limited. The question is to be up two days later without debate and a two-thirds vote restricts subsequent debate to one hour for each senator, and, except with the unanimous consent of the Senate, no amendments or substitutes for the measure in question can be considered following this action. The Senate adopted the new rule by a vote of 76 to 3. Senators La Follette of Wisconsin, Gronna of North Dakota, and Sherman of Illinois voted against it.

The rapid march of events produced by complete alterations in the situation between Germany and the United States, induced the president to change the date of the special session of the Sixty-Fifth Congress from April 16 to April 2. On that date, he appeared before the joint session and read an address asking for authority to declare war against Germany. This address will be found in the article **UNITED STATES AND THE WAR**.

The strength of the Republicans and Democrats in the House was so nearly equal that for a time it was doubtful which party would control. Finally, as the result of an action of three independent members, Champ Clark was again elected speaker.

The text of the resolution declaring war on Germany and a discussion of its adoption will be found in the article **UNITED STATES AND THE WAR**. See also **WAR OF THE NATIONS, The Diplomacy of the War**.

Congress at once began consideration of measures relating to the prosecution of the war, which the president desired passed. These included a bill for compulsory military service and an Espionage Bill providing for drastic restrictions on the activities of the press. Bills were also introduced empowering the president to

control the operation of private-owned railroads during the war; to control telegraph and telephone lines; to use the army for the protection of railroad lines; and to draft employees of railroad, telegraph, and telephone companies into the national service.

On April 14 the House passed, without a dissenting vote, a measure authorizing the largest loan ever voted at one time by any legislative body in the world. This authorized a bond issue of \$7,000,000,000. See FINANCIAL REVIEW.

On April 21, the Senate took up consideration of the Army Bill, and on April 23 consideration of the measure was begun in the House. The principle of conscription was strongly attacked by Speaker Clark on April 25, while the strongest advocate of a selective conscription system was Representative Kahn of California, a Republican.

On April 28, both the House and the Senate passed the bill for raising an army of 500,000 men by selective conscription: the Senate by a vote of 81 to 8, and the House by 397 to 24. In the Senate measure, the age of those conscripted was placed at the age of from 21 to 27 and in the House between 21 and 40.

The Senate on April 30 adopted a resolution authorizing the government to take title to the German ships in the harbors of the United States. On the same day there was introduced into the House the first of the Food Control Bills prepared by the administration. This provided \$25,000,000 and conferred broad powers upon the secretary of agriculture for the conservation of food resources. The Appropriations Committee, on the same day, reported a bill authorizing the expenditure of \$2,700,000,000 for army and navy purposes.

On May 1, René Viviani, leader of the French visiting conference commission, addressed the Senate. Two days later he addressed the House. On the same day there was introduced into the House a measure conferring power upon the president to fix maximum and minimum prices for food, fuel, etc., to regulate production and distribution, and to requisition establishments.

On May 4, the House passed the Espionage Bill after having modified the censorship provisions.

On the following day the House was addressed by Arthur J. Balfour, British secretary of state for foreign affairs and principal member of the mission to the United States. The House on May 7 passed a bill, already passed by the Senate, authorizing the operation of seized German vessels.

Mr. Balfour, on May 8, addressed the Senate. The House passed, on the same day, a bill increasing the strength of the navy from 87,000 to 150,000, and the marine corps to 30,000.

The House, on May 10, began debate on the War Taxation Bill designed to raise \$1,800,000,000 annually. The House, on May 12, voted to instruct its conferees on the Army Bill to agree to the provision adopted by the Senate, authorizing the president to accept a volunteer division of troops to be raised by Theodore Roosevelt.

The Senate, on May 14, passed the Espionage Bill after having eliminated the section relating to the censorship, and an amendment prohibiting the use of foodstuffs in alcoholic liquors. On May 15, the Senate passed a bill, already

passed by the House, increasing the personnel of the marine corps. The Financial Committee, on the same day, reported the measure authorizing the expenditure of \$3,390,946,000 for the army, navy, and shipping.

On May 16, the House finally passed the Selective Conscription Bill, with age liability from 21 to 30 inclusive, and on the following day, the Senate took similar action. The Senate, on May 19, passed, without a roll call, the General War Appropriation Bill authorizing the expenditure of \$3,342,300,000.

The Senate, on May 22, passed a bill appropriating \$50,000,000 for the establishment of the Bureau of War Risk Insurance in the Treasury Department, with the power not only to insure ships and cargo, but crews. Also on the same day, the Senate passed a bill increasing the number of Interstate Commerce Commissioners from 7 to 9, and permitting rules to be made by sub-divisions of the commission.

In the House on the same date, a letter was read from the president in which he declared it necessary that he should be given authority to exercise censorship over the press. The House, on the following day, passed, by a vote of 329 to 76, the War Taxation Bill, estimated to yield \$1,857,000,000 per year in additional revenue. The House, on May 28, passed the first of the Food Administration Bills advocated by the administration. This measure appropriated \$15,000,000 for a food survey or census for distributing seeds, and for educational work to stimulate production and decrease waste.

The Senate, three days later, adopted a drastic provision against the hoarding of food and other necessities as an amendment to the Food Survey Bill.

The House, on the same day, defeated the press censorship measure by a vote of 184 to 144.

On June 2, the Senate passed the Food Bill, already passed by the House. On June 15 that body approved the Espionage Bill with a clause authorizing the president to use an embargo power against neutrals in order to limit their importation of materials likely to reach the enemy, and also to compel them to furnish in return articles needed by the Allies.

June 14 and 15 were taken up by debate on the Railroad Control Bill in the Senate. Senators Lodge and Reed criticized the tendency to centralize legislative powers in the president. The Senate, on June 16, passed a measure giving the president power to enforce preferential shipping in interstate commerce of such commodities as he may from time to time designate.

On June 22, Baron Moncheur, head of the Belgian mission to the United States, addressed the Senate, and on the following day both branches of Congress were addressed by Boris Bakhmetieff, Russian Ambassador, and head of the Russian mission to the United States.

On the same day the House passed the second Food Administration Bill, placing broad power in the hands of the president. By a vote of 365 to 5, an amendment was adopted forbidding the use of food materials in the production of alcoholic beverages. The House, on June 27, passed a River and Harbor Appropriation Bill carrying \$27,000,000, and the measure already passed by the Senate increasing the Interstate Commerce Commission from 7 to 9 members.

In the Senate, on July 3, Senator Simmons,

chairman of the Financial Committee, introduced a war revenue measure estimated to raise \$1,670,000,000, as compared with \$1,810,420,000 carried by the measure prepared by the House. The Senate, after a debate, lasting for several days, adopted an amendment to the Food Administration Bill, prohibiting the manufacture and importation of whiskey during the war and directing the seizure of whiskey in bond at cost plus 10 per cent profit for the owners. The amendment was passed by a vote of 45 to 37.

On July 11, the House passed, without roll call, a measure regulating all trading with the enemy, known as the "Trading with the Enemy" Act. See FINANCIAL REVIEW.

The House, on July 14, passed without opposition, a bill appropriating \$640,000,000 for the construction and operation of aeroplanes.

The Senate, on July 19, adopted an amendment to the Food Control Bill, placing the authority in three men instead of one. On July 22, that body adopted a bill establishing government control over foods and fuel, by a board of three members. It fixed a minimum price of \$2 per bushel on 1918 wheat; prohibited the use of food materials in the production of distilled liquors and created a joint Congress Committee of ten members on "expenditures in the conduction of the war." The bill appropriating \$640,000,000 for aircraft, passed by the House, was adopted without change, on the same date. The Senate, on July 26, passed the Rivers and Harbors Appropriation Bill carrying \$28,000,000.

On August 2, the Senate, by a vote of 65 to 20, adopted the prohibition amendment. By the terms of the resolution, an amendment to the Federal constitution prohibiting the manufacture, sale, transportation, importation, or exportation of intoxicating liquors, is to be submitted to the States. It is not to be put into operation unless ratified within six years by two-thirds of the State legislatures. On the following day, the Senate adopted, without discussion, a resolution requesting the president to seek permission from foreign governments to apply the Selective Draft Law to their citizens in the United States. The Conference Committee of the Senate and the House, on the Food Administration Bill, on the same day, reached an agreement. The provisions for a Food Control Board of three members and for a Board on War Expenditures were adopted.

The House, on the following day, adopted the conference report on the Food Control and Food Survey Bills.

The Senate Financial Committee, on August 6, for the second time, reported the War Revenue Bill, which had been revised. The measure as re-read would yield \$2,600,970,000, an increase of \$337,000,000 over the amount carried in the former bill. The Senate, on August 8, adopted the conference report on the Food Control and Food Survey Bills. Senator La Follette, on August 11, introduced a resolution demanding a "re-statement of Allied peace terms based on the disavowal of advantages in the way of indemnities, territorial acquisitions, commercial privileges, or economic prerogatives."

The Financial Committee of the Senate and the House were informed, on August 9, by Mr. McAdoo, secretary of the treasury, that it would be necessary to raise by bond \$9,000,000,000, in addition to the \$1,700,000,000 already au-

thorized, and by taxation \$1,000,000,000 in addition to the \$2,000,000,000 already provided for in the revenue measure.

Debate on the War Revenue Bill occupied the attention of Congress until the middle of September. A full discussion of this measure will be found in the article TAXATION.

On September 5, Viscount Ishii, special Ambassador from Japan, addressed the House.

The House, on September 6, passed a bill providing for a bond issue of \$11,538,945,460, which includes a loan of \$4,000,000,000 to be made to the Allied governments, and on September 10, the Senate passed the War Revenue Bill by a vote of 69 to 4. The senators who voted against it were La Follette, Borah, Gronna, and Norris, all Republicans.

The bitterest fight in the Senate came over the item of taxes on excess war profits. The Finance Committee had provided for graduated taxes on the excess of profits over the average of the years 1911, 1912, 1913. The radical senators, including La Follette, Johnson, Gore, and others, wished to place much higher rates on excess profits, but in the final vote the conservative senators won. The bill as passed provided for \$2,416,000,000 in new taxes in addition to \$1,335,500 to be raised under laws already existing.

The Senate, on September 12, passed a resolution authorizing the president to draft alien residents for military service. On the same day it passed the "Trading with the Enemy" Bill with an amendment requiring newspapers published in German to print an English translation of contents on the war.

The House, on September 13, passed a Soldiers' and Sailors' Insurance and Compensation Bill, after important amendments had been made. See INSURANCE.

The Senate, on September 15, passed without a roll call the Bond Bill carrying \$11,538,000,000.

The House, on September 18, adopted the War Deficiency Bill carrying \$7,000,000,000, and included appropriations for the army, navy, and ships. On September 20, the Senate adopted the conference report on the Bond Bill and the Senate and the House conferees wrote in the "Trading with the Enemy" Bill a provision for censorship of mail and telegraph communications with foreign countries.

The Senate, on September 24, adopted the conference report on the "Trading with the Enemy" Bill, and on the following day this report was also adopted by the House.

On September 28, the House passed a bill permitting foreign ships to engage in American coastwise trade during the war. The Senate and the House conferees on the war revenue measure on September 29, reached an agreement. Many of its provisions were rewritten in conference. The revised measure is estimated to produce by additional taxation \$2,535,000,000 annually.

On October 1, the House adopted this report, and on the following day the Senate took similar action. The Senate, on October 3, adopted, without debate, the conference report on the Urgent Deficiency Bill carrying authorizations of \$7,657,000,000 for war expenditures.

The Senate, on October 4, adopted an amendment to the Soldiers' and Sailors' Insurance Bill reviving the rank of general for the com-

mander of the American troops in France, and for the chief of staff. The House, on the same date, adopted the Urgent Deficiency Bill.

The Senate, on October 5, adopted the conference report on the Soldiers' and Sailors' Insurance Bill, and passed a measure permitting foreign ships to engage in coastwise trade.

Senator La Follette, on October 6, made a long address in the Senate, in which he defended his criticism of the administration's war policy. His action was severely criticized in a speech by Senators Kellogg of Minnesota and Robinson of Arkansas. A special committee of five was appointed to investigate charges of disloyalty against Senator La Follette. On the same day the special session of the Sixty-Fifth Congress came to an end. The appropriations made aggregated \$21,000,000,000. It was in many respects the most important session of Congress ever held.

**THE SIXTY-FIFTH CONGRESS, SECOND SESSION.** The second session of the Sixty-Fifth Congress convened on December 3, 1917, and on the following day the president appeared before the joint session and read his message giving the reasons why a state of war should be declared with Austria-Hungary. See **UNITED STATES AND THE WAR; WAR OF THE NATIONS.**

On December 6, the Foreign Relations Committee of the Senate met to consider the portion of the message which urged an immediate declaration of war with Austria-Hungary, and on December 5, the Foreign Affairs Committee of the House entered upon a consideration of a similar resolution. Senator Owen of Oklahoma, on December 4, introduced a measure creating the "American Legion of Honor," with a life membership restricted to 200, the members to be named by the president and confirmed by the Senate. Membership in the Legion would be a reward "for very distinctive service" rendered either in the military service or by civilians.

On December 6, the Committee of Foreign Affairs of the House, made a favorable report on the resolution declaring war with Austria, and on December 7, the joint resolution was passed (see the article **UNITED STATES AND THE WAR**). In the Senate the resolution passed without debate by a vote of 74 to 0.

On December 14, the Military Committee of the Senate voted to institute a general inquiry into the operations of the War Department in the matter of arming and equipping the American military forces. On the same day, Senator Lodge introduced a resolution which was adopted providing for the investigation of the shortage in sugar and coal. A national prohibition amendment to the Constitution was favorably reported to the House from the Judiciary Committee by a vote of 15 to 5.

On December 13, the Senate Committee on Manufactures began hearings in the cases of the shortage of coal and sugar. See **COAL; SUGAR.**

On December 16, the session of the House was devoted to the consideration of the national prohibition amendment and on the same day passed the bill (see **LIQUOR REGULATION**). The vote was 282 to 128. The Senate, by a rising vote of 47 to 8, concurred in the House amendment.

On December 18, the Senate passed two resolutions for additional investigations. These included an inquiry into the control of the trans-

portation companies of the country and into the condition of their affairs by the United States Shipping Board.

Congress adjourned over the holidays on December 21, but the committees of inquiry continued their session.

**CONGRESSIONAL MEMBERSHIP.** The following table gives the membership and political affiliation of the members of the Sixty-Fifth Congress:

[Democrats in roman; Republicans in *italics*; Progressives in SMALL CAPS; Progressive and Republican in *italics* with \*; Independent in CAPS; Prohibitionist in roman with \*; Socialist in black letter; Progressive-Protectionist in CAPS with \*; Progressive-Democrat in SMALL CAPS with \*; Non-partisan in *ITALIC CAPS*.]

**ALABAMA.**—SENATORS: John H. Bankhead, Oscar W. Underwood. REPRESENTATIVES (Democrats, 10): Oscar L. Gray, S. Hubert Dent, Jr., Henry B. Steagall, Fred L. Blackmon, J. Thomas Hedlin, William B. Oliver, John L. Burnett, Edward B. Almon, George Huddleston, William B. Bankhead.

**ARIZONA.**—SENATORS: Henry F. Ashurst, Marcus A. Smith. REPRESENTATIVE (Democrat, 1): At large, Carl Hayden.

**ARKANSAS.**—SENATORS: Joseph T. Robinson, William F. Kirby. REPRESENTATIVES (Democrats, 7): Thaddeus H. Caraway, William A. Oldfield, John N. Tillman, Otis Wingo, Henderson M. Jacobway, Samuel M. Taylor, William S. Goodwin.

**CALIFORNIA.**—SENATORS: James D. Phelan, Hiram W. Johnson. REPRESENTATIVES (Democrats, 4): Republicans, 6; Prohibitionist, 1: Clarence F. Lea, John E. Raker, Charles F. Curry, Julius Kahn, John I. Nolan, John A. Elston, Denver S. Church, Everts A. Hayes, Charles H. Randall, Henry Z. Osborne, William Kettner.

**COLORADO.**—SENATORS: Charles S. Thomas, John F. Shafroth. REPRESENTATIVES (Democrats, 3; Republicans, 1): Benjamin C. Hilliard, Charles B. Timberlake, Edward Keating, Edward T. Taylor.

**CONNECTICUT.**—SENATORS: Frank B. Brandegee, George P. McLean. REPRESENTATIVES (Democrat, 1; Republicans, 4): Augustine Lonergan, Richard P. Freeman, John Q. Tilson, Schuyler Merritt, James P. Glyn.

**DELAWARE.**—SENATORS: Willard Saulsbury, Josiah O. Wolcott. REPRESENTATIVE (Democrat, 1): At large, Albert F. Polk.

**FLORIDA.**—SENATORS: Duncan U. Fletcher, Park Trammell. REPRESENTATIVES (Democrats, 4): Herbert J. Drane, Frank Clark, Walter Kehoe, William J. Sears.

**GEORGIA.**—SENATORS: Hoke Smith, Thomas W. Hardwick. REPRESENTATIVES (Democrats, 12): James W. Overstreet, Frank Park, Charles R. Crisp, William C. Wright, William S. Howard, James W. Wise, Gordon Lee, Charles H. Grand, Thomas M. Bell, Carl Vinson, J. Randall Walker, William W. Larsen.

**IDaho.**—SENATOR: William E. Borah. REPRESENTATIVES (Republicans, 2): At large, Burton L. French, Addison T. Smith.

**ILLINOIS.**—SENATORS: Jas. Hamilton Lewis, Lawrence Y. Sherman. REPRESENTATIVES (Democrats, 5; Republicans, 21; Vacancy, 1): At large, Medul McCormick, William E. Mason, Martin R. Madden, James R. Mann, William W. Wilson, Adolph J. Sabath, James McAndrews, Niels Just, Thomas Gallagher, Fred A. Britten, George E. Foss, Ira C. Copley, Charles E. Fuller, John O. McKenzie, William J. Graham, Edward J. King, Clifford Ireland, John A. Sterling, Joseph G. Cannon, William R. McKinley, Henry T. Rainey, Loren E. Wheeler, William A. Rodenberg, Martin D. Foster, Thomas S. Williams, Edward E. Denton.

**INDIANA.**—SENATORS: James E. Watson, Harry A. New. REPRESENTATIVES (Democrats, 4; Republicans, 9): George K. Denton, Oscar E. Bland, William E. Cox, Lincoln Dixon, Everett Sanders, Richard N. Elliott, Merrill Moores, Albert H. Vestal, Fred S. Purnell, William R. Wood, Milton Krous, Louis W. Fairfield, Henry A. Barnhart.

**IOWA.**—SENATORS: Albert B. Cummins, William S. Kenyon. REPRESENTATIVES (Republicans, 11): Charles A. Kennedy, Harry E. Hull, Burton E. Sweet, Gilbert N. Hawgen, James W. Good, C. William Ramseyer, Cassius C. Dowell, Horace M. Townner, William R. Green, Frank P. Woods, George C. Scott.

**KANSAS.**—SENATORS: William H. Thompson, Charles Curtis. REPRESENTATIVES (Democrats, 5; Republicans, 3): Daniel R. Anthony, Jr., Edward C. Little, Philip P. Campbell, Dudley Doolittle.

Guy T. Helvering, John R. Connelly, Jouett Shouse, William A. Ayres.

**KENTUCKY.**—SENATORS: Ollie M. James, J. C. W. Beckham. REPRESENTATIVES (Democrats, 9; Republicans, 2): Alben W. Barkley, David H. Kincheloe, Robert Y. Thomas, Jr., Ben Johnson, Swager Sherley, A. B. Rouse, J. Campbell Cantrill, Harvey Helm, William J. Fields, John W. Langley, *Caled Powers.*

**LOUISIANA.**—SENATORS: Joseph E. Ransdell, Robert F. Broussard. REPRESENTATIVES (Democrats, 7; Progressive-Protectionist, 1): Albert Estopinal, H. Garland Dupré, WHITMELL P. MARTIN,\* John T. Watkins, Riley J. Wilson, Jared Y. Sanders, Ladislav Lazaro, James B. Aswell.

**MAINE.**—SENATORS: Bert M. Fernald, Frederick Hale. REPRESENTATIVES (Republicans, 4): Louis B. Goodall, Wallace H. White, Jr., John A. Peters, Ira G. Hersey.

**MARYLAND.**—SENATORS: John Walter Smith, Joseph I. France. REPRESENTATIVES (Democrats, 4; Republicans, 2): Jesse D. Price, J. Fred. C. Talbott, Charles P. Coady, J. Charles Lanthicum, Sydney E. Mudd, Frederick N. Zithman.

**MASSACHUSETTS.**—SENATORS: Henry Cabot Lodge, John W. Weeks. REPRESENTATIVES (Democrats, 4; Republicans, 11; Independent, 1): Allen T. Treadway, Frederick H. Gillett, Calvin D. Paige, Samuel E. Winslow, John Jacob Rogers, Willfred W. Lufkin, Michael F. Phelan, Frederick W. Dallinger, ALVAN T. FULLER, Peter F. Tague, George Holden Tinkham, James A. Gallivan, William H. Carter, Richard Olney, William S. Greene, Joseph Walsh.

**MICHIGAN.**—SENATORS: William Alden Smith, Charles E. Townsend. REPRESENTATIVES (Democrats, 2; Republicans, 11): Frank E. Doremus, Samuel W. Beakes, J. M. O. Smith, Edward L. Hamilton, Carl E. Mages, Patrick H. Kelley, Louis O. Cramton, Joseph W. Fordney, James C. McLaughlin, Gilbert A. Currie, Frank D. Scott, W. Frank James, Charles A. Nichols.

**MINNESOTA.**—SENATORS: Knute Nelson, Frank B. Kellogg. REPRESENTATIVES (Democrat, 1; Republicans, 8; Progressive, 1): Sydney Anderson, Franklin F. Ellsworth, Charles R. Davis, Carl C. Van Dyke, Ernest Lundeen, Harold Knutson, Andrew J. Volstead, Clarence B. Miller, Halvor Steenerson, THOMAS D. SCHALL.

**MISSISSIPPI.**—SENATORS: John Sharp Williams, James K. Vardaman. REPRESENTATIVES (Democrats, 8): Ezekiel S. Candler, Hubert D. Stephens, Benjamin G. Humphreys, Thomas U. Sisson, William W. Venable, Pat Harrison, Percy E. Quin, James W. Collier.

**MISSOURI.**—SENATORS: William J. Stone, James A. Reed. REPRESENTATIVES (Democrats, 14; Republicans, 2): Milton A. Romjue, William W. Rucker, Joshua W. Alexander, Charles F. Booher, William P. Borland, Clement C. Dickinson, Courtney W. Hamlin, Dorsey W. Shackelford, Champ Clark, Jacob E. Meeker, William L. Igoe, Leonidas C. Dyer, Walter L. Hensley, Joseph J. Russell, Perl D. Decker, Thomas L. Rubey.

**MONTANA.**—SENATORS: Henry L. Myers, Thomas J. Walsh. REPRESENTATIVES (Democrat, 1; Republican, 1): At large, John M. Evans, Jeannette Rankin.

**NEBRASKA.**—SENATORS: Gilbert M. Hitchcock, George W. Norris. REPRESENTATIVES (Democrats, 3; Republicans, 3): O. Frank Reavis, Charles O. Lobeck, Dan V. Stephens, Charles H. Sloan, Ashton C. Shallenberger, Moses P. Kinkaid.

**NEVADA.**—SENATORS: Key Pittman, Charles B. Henderson. REPRESENTATIVE (Republican, 1): At large, E. E. Roberts.

**NEW HAMPSHIRE.**—SENATORS: Jacob H. Gallinger, Henry F. Hollis. REPRESENTATIVES (Republicans, 2): Sherman E. Burroughs, Edward H. Wason.

**NEW JERSEY.**—SENATORS: William Hughes, Joseph S. Frelinghuysen. REPRESENTATIVES (Democrats, 8; Republicans, 9): William J. Browning, Isaac Bacharach, Thomas J. Scully, Elijah O. Hutchinson, John H. Capstick, John R. Ramsey, Dow H. Drucker, Edward W. Gray, Richard Wayne Parker, Frederick R. Lehibach, John J. Eagan, James A. Hamill.

**NEW MEXICO.**—SENATORS: Albert B. Fall, Andrieus A. Jones. REPRESENTATIVE (Democrat, 1): At large, William B. Walton.

**NEW YORK.**—SENATORS: James W. Wadsworth, Jr., William M. Calder. REPRESENTATIVES (Democrats, 12; Republicans, 26; Socialist, 1; Vacancies, 4): Frederick C. Hicks, Chas. Pone Caldwell, Joseph V. Flynn, Harry H. Dale, James P. Maher, Frederick W. Rowe, Oscar Wm. Swift, Reuben L. Haskell, Daniel J. Riordan, Meyer London, Christopher D. Sullivan, Fiorello H. LaGuardia, Thomas F. Smith,

Peter J. Dooling, John F. Carew, George B. Francis, Walter M. Chandler, Isaac Siegel, Daniel C. Oliver, Benjamin L. Fairchild, James W. Husted, Edmund Platt, Charles B. Ward, Rollin B. Sanford, James S. Parker, George R. Lunn, Bertrand H. Snell, Luther W. Mott, Homer P. Snyder, George W. Fairchild, Walter W. Magee, Norman J. Gould, Harry H. Pratt, Thomas B. Dunn, Archie D. Sanders, S. Wallace Dempsey, Charles B. Smith, William F. Walcott, Charles M. Hamilton.

**NORTH CAROLINA.**—SENATORS: F. M. Simmons, Lee S. Overman. REPRESENTATIVES (Democrats, 10): John H. Small, Claude Kitchin, George E. Hood, Edward W. Fou, Charles M. Stedman, Hannibal L. Godwin, Leonidas D. Robinson, Robert L. Doughton, Edwin Y. Webb, Zebulon Weaver.

**NORTH DAKOTA.**—SENATORS: Porter J. McCumber, Asle J. Gronna. REPRESENTATIVES (Republicans, 2; Non-partisan, 1): JOHN M. BAER, George M. Young, Patrick D. Norton.

**OHIO.**—SENATORS: Atlee Pomerene, Warren G. Harding. REPRESENTATIVES (Democrats, 12; Republicans, 9; vacancy, 1): Nicholas Longworth, Victor Heints, Warren Gard, Benjamin F. Welty, John S. Snook, Charles O. Kearns, Simeon D. Fess, John A. Key, Isaac R. Sherwood, Robert M. Soltzner, Horatio C. Claypool, Clement Brumbaugh, Arthur W. Overmyer, George White, Roscoe O. McCulloch, William A. Ashbrook, David A. Hollingsworth, John G. Cooper, William Gordon, Robert Crosser, Henry I. Emerson.

**OKLAHOMA.**—SENATORS: Thomas P. Gore, Robert L. Owen. REPRESENTATIVES (Democrats, 6; Republicans, 2): Thomas A. Chandler, William W. Hastings, Charles D. Carter, Tom D. McKeown, Joseph B. Thompson, Scott Ferris, James V. McClintic, Dick T. Morgan.

**OREGON.**—SENATORS: George E. Chamberlain, Charles L. McNary. REPRESENTATIVES (Republicans, 3): Willie O. Hawley, Nicholas J. Sinnott, Clifton M. McArthur.

**PENNSYLVANIA.**—SENATORS: Boies Penrose, Philander C. Knox. REPRESENTATIVES (Democrats, 7; Republicans, 28; Independent, 1): At large, Thomas S. Crago, Mahon M. Garland, Joseph McLaughlin, John K. K. Scott, William S. Yare, George S. Graham, J. Hampton Moore, George W. Edmonds, Peter E. Costello, George P. Darrow, Thomas S. Butler, Henry W. Watson, W. W. Griest, John R. Farr, Thomas W. Templeton, Robert D. Heaton, Arthur G. Dewalt, Louis T. McFadden, Edgar R. Kiees, John V. Leshner, Benjamin K. Focht, Aaron S. Kreider, John M. Rose, Andrew R. Brodbeck, Charles H. Rowland, Edward E. Robbins, Bruce F. Sterling, Henry W. Temple, Henry A. Clark, Henry J. Steele, Nathan L. Strong, Earl H. Beshlin, Stephen G. Porter, M. CLYDE KELLY, John M. Morin, Guy E. Campbell.

**RHODE ISLAND.**—SENATORS: LeBaron B. Colt, Peter G. Gerry. REPRESENTATIVES (Democrat, 1; Republicans, 2): George F. O'Shaunessy, Walter R. Stiness, Ambrose Kennedy.

**SOUTH CAROLINA.**—SENATORS: Benjamin R. Tillman, Ellison D. Smith. REPRESENTATIVES (Democrats, 7): Richard S. Whaley, James F. Byrnes, Fred H. Dominick, Samuel J. Nicholls, William F. Stevenson, J. Willard Ragsdale, Asbury F. Lever.

**SOUTH DAKOTA.**—SENATORS: Thomas Sterling, Edwin S. Johnson. REPRESENTATIVES (Democrat, 1; Republicans, 2): Charles H. Dillon, Royal O. Johnson, Harry L. Gandy.

**TENNESSEE.**—SENATORS: John K. Shields, Kenneth McKellar. REPRESENTATIVES (Democrats, 8; Republicans, 2): Sam R. Sells, Richard W. Austin, John A. Moon, Cordell Hull, William C. Houston, Joseph W. Byrns, Lemuel P. Padgett, Thetus W. Sims, Finis J. Garrett, Hubert F. Fisher.

**TEXAS.**—SENATORS: Charles A. Culberson, Morris Sheppard. REPRESENTATIVES (Democrats, 18): At large, Jeff. McLemore, Daniel E. Garrett, Eugene Black, Martin Dies, James Young, Sam Rayburn, Hattin W. Sumners, Rufus Hardy, Alexander W. Gregg, Joe H. Eagle, Joseph J. Mansfield, James P. Buchanan, Tom Connally, James C. Wilson, Marvin Jones, James L. Slayden, John N. Garner, Thomas L. Blanton.

**UTAH.**—SENATORS: Reed Smoot, William H. King. REPRESENTATIVES (Democrat, 1; Progressive-Democrat, 1): Milton H. Welling, JAMES H. MATS.\*

**VERMONT.**—SENATORS: William P. Dillingham, Carroll S. Page. REPRESENTATIVES (Republicans, 2): Frank L. Greene, Porter H. Dale.

**VIRGINIA.**—SENATORS: Thomas S. Martin, Claude A. Swadlow. REPRESENTATIVES (Democrats, 9; Republican, 1): William A. Jones, Edward E. Holland, Andrew J. Montague, Walter A. Watson, Edward W. Saunders, Carter Glass, Thomas W.

Harrison, Charles C. Carlin, C. Bascom Slomp, Henry D. Flood.

WASHINGTON.—SENATORS: Wesley L. Jones, Miles Poindexter. REPRESENTATIVES (Democrat, 1; Republicans, 4): John F. Miller, Lindley H. Hadley, Albert Johnson, William L. La Follette, C. C. Dill.

WEST VIRGINIA.—SENATORS: Nathan Goff, Howard Sutherland. REPRESENTATIVES (Democrats, 2; Republicans, 4): M. M. Neely, George M. Bowers, Stuart F. Reed, Harry O. Woodyard, Edward Cooper, Adam B. Littlepage.

WISCONSIN.—SENATOR: Robert M. La Follette. REPRESENTATIVES (Republicans, 11): Henry Allen Cooper, Edward Voigt, John M. Nelson, William J. Cary, William H. Stafford, James H. Davidson, John J. Each, Edward E. Browne, David G. Olsson, James A. Frear, Irvine L. Lenroot.

WYOMING.—SENATORS: Francis E. Warren, John B. Kendrick. REPRESENTATIVE (Republican, 1): At large, Frank W. Mondell.

ALASKA.—Charles A. Sulzer.

HAWAII.—J. Kukio Kalamanaole.

PHILIPPINES.—Jaime C. De Veyra, Teodoro R. Yanco.

PORTO RICO.—Felix Cordova Davila.

**POLITICAL PARTIES.** A convention of the Progressive party in combination with radicals from other parties, opened in St. Louis on April 13. The fundamental purpose of the meeting was to organize the liberal forces of the nation into a common League of Liberals, which would continue the work of reform outlined in the 1912 platform of the National Progressive Party. The delegates announced a war platform for liberals which included the declaration of universal military service, graduated taxation, freedom of political discussion, and no retrenchment of expenditures for education and research. It advocated national regulation of the food supply, and of labor conditions in industry.

On October 3, representatives of the National Progressive Party, supporters of the single tax, and some members of the Socialist Party met in Chicago to discuss the organization of the new Radical Party. Each of the four groups was assigned twenty votes in the convention. Delegates decided to arrange for coöperation in Congressional elections of 1918. Among those who were prominent at the meeting were Matthew Hale, chairman of the National Committee of the Progressive Party, Dr. Landrith, Prohibitionist candidate for vice-president in 1916, and John Spargo, Socialist author. Spargo suggested a platform which contained recommendations for universal suffrage, the initiative, referendum, and recall, the short ballot, executive budget and proportional representation, an easier method of securing constitutional amendments, national prohibition, public ownership of mines, railroads, telegraphs, and telephones, the extinction of land monopolies, and the abolition of secret diplomacy and international federation. He and others emphasized the loyalty of the conference to the American cause in the great war, and declared that pro-Germans would not be welcome to the new party.

The declaration of war with Germany, and the preparations leading to a state of hostilities, had a profound effect upon the Socialist Party in the United States. On account of the attitude of the organization in opposition to selective draft and other phases of the war programme of the United States, the best-known leaders of the party withdrew from affiliation with it. These included John Spargo, Robert Hunter, and others of that type. It thus left the control of the party in the hands of the ultra-radical group, whose most conspicuous member was Victor L. Berger, of Milwaukee.

As is noted in the article **NEW YORK**, Morris Hillquit was nominated for mayor by the Socialist Party, and polled a large vote, which indicated a very considerable growth in Socialist sentiment in that city.

On September 24, 1917, the Socialist Party National Council went out of existence. The affairs of the Socialist Party were placed in the hands of a National Executive Council consisting of four members, Morris Hillquit of New York, Victor L. Berger of Milwaukee, John M. Work of Chicago, and Anna A. Maley of Minnesota. A newly adopted constitution provided for five members, but John Spargo, named as the fifth member, declined to serve. Under the new constitution, the country is divided into five districts and three men are to be elected from each district. The call for nominations was sent out for January 1, 1918, and the members of the council will begin their term of office on July 1, 1918.

**STATE LEGISLATURES.** The following list shows the present complexion of the legislatures of the various States in 1917:

Alabama.—The legislature is almost wholly Democratic.

Arkansas.—The legislature is almost wholly Democratic.

California.—A Republican majority of 56 on joint ballot.

Connecticut.—A Republican majority of 145 on joint ballot.

Delaware.—A majority of 3 Republicans in the Senate and 3 Democrats in the House.

Georgia.—The legislature is almost wholly Democratic.

Idaho.—A Democratic majority of 12 on joint ballot.

Illinois.—A Republican majority of 3 on joint ballot.

Indiana.—A Republican majority of 28 on joint ballot.

Iowa.—A Republican majority of 110 on joint ballot.

Kansas.—A Republican majority of 107 on joint ballot.

Kentucky.—A Democratic majority of 83 on joint ballot.

Louisiana.—The legislature is almost wholly Democratic.

Maine.—A Republican majority of 84 on joint ballot.

Maryland.—No legislative session in 1917.

Massachusetts.—A Republican majority of 114 on joint ballot.

Michigan.—A Republican majority of 96 on joint ballot.

Minnesota.—A non-partisan legislature.

Mississippi.—The legislature is wholly Democratic.

Missouri.—A Democratic majority of 32 on joint ballot.

Montana.—A Republican majority of 10 on joint ballot.

Nebraska.—A Democratic majority of 35 on joint ballot.

Nevada.—On joint ballot, Republicans 27, Democrats 26, and Independent 1.

New Hampshire.—A Republican majority of 88 on joint ballot.

New Jersey.—A Republican majority of 41 on joint ballot.

FOUR UNITED STATES REPRESENTATIVES PROMINENT IN 1917

New Mexico.—A Republican majority of 13 on joint ballot.

New York.—Republicans 133, Democrats 57, Socialists 10 on joint ballot.

North Carolina.—A Democratic majority of 108 on joint ballot.

North Dakota.—A Republican majority of 118 on joint ballot.

Oklahoma.—A Democratic majority of 91 on joint ballot.

Oregon.—A Republican majority of 68 on joint ballot.

Pennsylvania.—A Republican majority on joint ballot.

Rhode Island.—A Republican majority of 44 on joint ballot.

South Carolina.—The legislature is wholly Democratic.

South Dakota.—A Republican majority of 44 on joint ballot.

Tennessee.—A Democratic majority of 66 on joint ballot.

Texas.—The legislature is wholly Democratic.

Utah.—A Democratic majority of 46 on joint ballot.

Vermont.—A Republican majority of 177 on joint ballot.

Virginia.—A Democratic majority of 108 on joint ballot.

Washington.—A Democratic majority of 101 on joint ballot.

West Virginia.—A Republican majority of 10 in the Senate, and a Democratic majority of 10 in the House.

Wisconsin.—A Republican majority of 75 on joint ballot.

Wyoming.—A Republican majority of 12 on joint ballot.

**FOREIGN RELATIONS.** The relations of the United States with foreign countries during 1917 were concerned chiefly with the declaration of war with Germany and Austria-Hungary. These are dealt with at length in the article **UNITED STATES AND THE WAR**, and in the section on *Diplomacy* in the article **WAR OF THE NATIONS**. The notes given below record the most important happenings in foreign relations aside from the countries of Europe.

The joint commission of American and Mexican officials, which was appointed in 1916 to attempt to adjust the difficulties between the two countries, finished their labors in January, 1917. The American commissioners, Mr. Lane, secretary of the interior, Judge Gray, and John R. Mott, recommended in their report the withdrawal of the Americans operating in Mexico, and the sending of Henry P. Fletcher as Ambassador from the United States to Mexico. They advised, also, that further negotiations with Mexico be carried on through the regular diplomatic channels.

The larger tasks, undertaken by the commission, were left unsettled, owing to the fact of the failure of the Mexican government to ratify the Protocol, which was the result of the deliberations. The problem of guarding the American border was left unsolved, and the question of the international problems of Mexico, which President Wilson desired especially to have considered by the commission, was not touched upon. The commission, however, rendered good service by increasing the confidence and good feeling between the two governments. As a result, President Carranza assumed a more friendly attitude than he had hitherto shown.

Following the recommendations of the commission, arrangements were at once begun to withdraw the American forces from Mexico, and for reducing the number of militia on guard along the frontier.

The last American troops left Mexico in the first week in February. When Gen. Pershing took command at El Paso nearly 4000 refugees

followed the American troops across the border. These included some 2000 Mexicans and a number of Chinese, who, in spite of the immigration laws, were admitted temporarily into the United States.

The secretary of war sent Gen. Pershing a letter commending the work of the armies in Mexico, mentioning especially the restraint imposed by both officers and men upon themselves, and their consideration of the people of Mexico and the public authorities of that country.

At about the time of this withdrawal, Henry P. Fletcher started for Mexico to present his credentials to the authorities of the government of Mexico, at Querepare, where the constitutional convention was in session.

The proposed treaty with Colombia, whose ratification by the Senate had been delayed for many months, was again put over to the special session of Congress.

This treaty contains expressions of regrets for the lapse of friendly relations between the two nations, and provides for an appropriation of \$25,000,000 to cover the claims of Colombia.

The control of the United States over Santo Domingo, which amounted practically to a protectorate, was continued during 1917. There were no events of special importance. A force of marines was maintained on the island during the year.

On November 2, Secretary Lansing and Viscount Ishii, the special Japanese Ambassador, exchanged notes dealing with the policy of the United States and Japan in regard to China. These notes were as follows:

DEPARTMENT OF STATE,  
Washington, November 2, 1917.

**EXCELLENCY:** I have the honor to communicate herein my understanding of the agreement reached by us in our recent conversations touching the questions of mutual interest to our governments relating to the Republic of China.

In order to silence mischievous reports that have from time to time been circulated it is believed by us that a public announcement once more of the desires and intentions shared by our two governments with regard to China is advisable.

The governments of the United States and Japan recognise that territorial propinquity creates special relations between countries, and, consequently, the government of the United States recognises that Japan has special interests in China, particularly in the part to which her possessions are contiguous.

The territorial sovereignty of China, nevertheless, remains unimpaired and the government of the United States has every confidence in the repeated assurances of the Imperial Japanese government that while geographical position gives Japan such special interests, they have no desire to discriminate against the trade of other nations or to disregard the commercial rights heretofore granted by China in treaties with other powers.

The governments of the United States and Japan deny that they have any purpose to infringe in any way the independence or territorial integrity of China, and they declare, furthermore, that they always adhere to the principle of the so-called "open door," or equal opportunity for commerce and industry in China.

Moreover, they mutually declare that they are opposed to the acquisition by any government of any special rights or privileges that would affect the independence or territorial integrity of China or that would deny to the subjects or citizens of any country the full enjoyment of equal opportunity in the commerce and industry of China.

I shall be glad to have Your Excellency confirm this understanding of the agreement reached by us. Accept, Excellency, the renewed assurance of my highest consideration.

(Signed) ROBERT LANSING.  
His Excellency VISCOUNT KIKUJIRO ISHII, Ambassador Extraordinary and Plenipotentiary of Japan, on Special Mission.

## REPLY OF SPECIAL AMBASSADOR

## THE SPECIAL MISSION OF JAPAN.

*Washington, November 2, 1917.*

SIR: I have the honor to acknowledge the receipt of your note of to-day, communicating to me your understanding of the agreement reached by us in our recent conversations touching the questions of mutual interest to our governments relating to the Republic of China.

I am happy to be able to confirm to you, under authorization of my government, the understanding in question set forth in the following terms:

In order to silence mischievous reports that have from time to time been circulated, it is believed by us that a public announcement once more of the desires and intentions shared by our two governments with regard to China is advisable.

The governments of Japan and the United States recognize that territorial propinquity creates special relations between countries, and, consequently, the government of the United States recognizes that Japan has special interests in China, particularly in the part to which her possessions are contiguous.

The territorial sovereignty of China, nevertheless, remains unimpaired, and the government of the United States has every confidence in the repeated assurances of the Imperial Japanese government that while geographical position gives Japan such special interests they have no desire to discriminate against the trade of other nations or to disregard the commercial rights heretofore granted by China in treaties with other powers.

The governments of Japan and the United States deny that they have any purpose to infringe in any way the independence or territorial integrity of China and they declare, furthermore, that they always adhere to the principle of the so-called "open door" or equal opportunity for commerce and industry in China.

Moreover, they mutually declare that they are opposed to the acquisition by any government of any special rights or privileges that would affect the independence or territorial integrity of China or that would deny to the subjects or citizens of any country the full enjoyment of equal opportunity in the commerce and industry of China.

I take this opportunity to convey to you, sir, the assurances of my highest consideration.

(Signed)

K. ISHII.

*Ambassador Extraordinary and Plenipotentiary of Japan on Special Mission.*

Hon. ROBERT LANSING,

Secretary of State.

**WAR BOARDS AND COMMISSIONS.** The following are the most important boards and commissions having relations to the conduct of the war as they were constituted in January, 1917:

## UNITED STATES SHIPPING BOARD

*Chairman.*—Edward N. Hurley.  
*Assistant to chairman.*—Frank B. Lord.  
*Confidential clerk.*—John E. Barber.  
*Confidential clerk.*—Richard H. Bailey, Jr.

*Vice-chairman.*—R. B. Stevens.*Commissioners.*

John A. Donald.

Bainbridge Colby.

Charles R. Page.

*Secretary.*—Lester Sisler.*Director of operations.*—Edward F. Carry.*Assistant director of operations.*—David L. Ewing.*Assistant to director of operations.*—Clifford D. Mallory.*Chief counsel.*—Edward B. Burling.*Admiralty counsel.*—Alfred Huger.*Chief clerk and disbursing officer.*—William L. Boleau.

## UNITED STATES SHIPPING BOARD EMERGENCY FLEET CORPORATION

## DIRECTORS AND GENERAL OFFICERS

*President.*—Edward N. Hurley.*Vice-president.*—John A. Donald.*Treasurer.*—Raymond B. Stevens.

Bainbridge Colby.

Charles R. Page.

Capt. E. P. Bertholf.

Charles Plez.

*Secretary.*—Lester Sisler.

## ADMINISTRATIVE OFFICERS

*Vice-president and general manager.*—Charles Plez.*Office manager.*—George E. Oller.*Chief clerk.*—Laurence Leonard.*Managers of divisions.**Steel-ship construction.*—F. T. Bowles.*Wood-ship construction.*—James O. Heyworth.*Shipyard plants.*—Rear Admiral H. H. Rousseau.

U. S. N.

*Contracts.*—George S. Radford.*Transportation.*—F. C. Joubert.*General purchasing officer.*—F. A. Browne.*General auditor.*—D. H. Bender.*General counsel.*—John Barton Rayne.

## DIRECTOR GENERAL OF RAILROADS

*Director General.*—William G. McAdoo. (Private secretary, Oscar A. Price.)

## MEMBERS OF ADVISORY BOARD

John Skelton Williams.

Hale Holden.

Henry Walters.

Edward Chambers.

Walter D. Hines (ex officio).

## COUNCIL OF NATIONAL DEFENSE

## THE COUNCIL

*Chairman.*—The Secretary of War.

The Secretary of the Navy.

The Secretary of the Interior.

The Secretary of Agriculture.

The Secretary of Commerce.

The Secretary of Labor.

## THE ADVISORY COMMISSION

*Chairman.*

Bernard M. Baruch, Howard E. Coffin, Hollis

Godfrey, Samuel Gompers, Dr. Franklin H.

Martin, Julius Rosenwald.

*Director of the council and of the advisory com-**mission.*—Walter S. Gifford.*Secretary of the council and of the advisory com-**mission.*—Grosvenor B. Clarkson.*Chief clerk and disbursing officer.*—E. K. Ellsworth.

## WAR TRADE BOARD

*Chairman.*—Vance C. McCormick, representative of

the Secretary of State.

Albert Strauss, representative of the Secretary

of the Treasury.

Alonzo E. Taylor, representative of the Secretary

of Agriculture.

Thomas D. Jones, representative of the Secretary

of Commerce.

Clarence M. Woolley, representative of the Sec-

retary of Commerce.

John Beaver White, representative of the

Administrator.

Frank C. Munson, representative of the United

States Shipping Board.

*Counselor.*—Thomas L. Chadbourne, Jr.*Secretary.*—Lawrence Bennett.

## BUREAUS OF THE WAR TRADE BOARD

*Bureau of exports.*—C. A. Richards, director.*Bureau of imports.*—F. B. Petersen, director; P.

Chauncey Anderson, counsel.

*Bureau of war trade intelligence.*—Paul Fuller, Jr.,

director.

*Bureau of transportation.*—L. L. Richards, direc-

tor.

*Bureau of administration.*—Harry A. Engman, Jr.,

director.

*Bureau of research.*—Allyn A. Young, director.*Bureau of tabulation and statistics.*—Lowell J.

Reed, director.

*Bureau of foreign agents and reports.*—Charles

Denby, director.

*Bureau of enemy trade.*—J. H. Hammond, director.

## UNITED STATES FOOD ADMINISTRATION

*Food Administrator.*—Herbert Hoover.*Chief clerk.*—Clinton R. Whitney.

## UNITED STATES FUEL ADMINISTRATION

*Fuel Administrator.*—Harry A. Garfield.*Secretary to Fuel Administrator.*—Van. H. Manning

Jr.

## PRIORITY IN TRANSPORTATION

*Commissioner.*—Robert S. Lovett.*Assistant.*—G. W. Kirtley.*Secretary.*—Ralph B. Feagin.

## ALIEN PROPERTY CUSTODIAN

*Alien Property Custodian.*—A. Mitchell Palmer.*Managing director.*—J. Lionberger Davis.

#### UNITED STATES AND THE WAR. PEACE PROPOSALS.

In the first days of 1917 the chief aspect of the war, as regards the people of the United States, was the possibility of an early peace. On December 18, 1916, President Wilson had transmitted to the diplomatic representatives in the warring countries, as well as to neutral nations, a communication in which he suggested that the time had now come for declaring "the precise objects which would, if attained, satisfy them and their people that the war had been fought out" (see preceding *YEAR BOOK*, article on *WAR OF THE NATIONS*). Up to the end of the year Germany was the only country at war which had replied to the president's note. This answer was brief and evasive. The Allied Powers, on December 30, 1916, replied through president Wilson to the original German peace proposal. This reply was in effect a summing up of the cause of the Allies, with an assertion that peace could not be secured without reparation, restitution, and the assurance of the impossibility of future wars on the part of Germany.

The United States Senate, on January 5, by a vote of 48 to 17, passed the resolution, introduced by Senator Hitchcock, approving in the following terms the president's action in sending the diplomatic note of December 18: "Resolved, that the Senate approves and strongly endorses the request of the president in the diplomatic note of December 18, to the nations now engaged in the war, that these nations state the terms upon which peace might be discussed." During the discussion of the resolution, Senators Lodge of Massachusetts and Borah of Idaho attacked the diplomatic policy of the administration. In the final vote on the resolution, ten Republicans voted with the Democrats in its favor. On January 10, the Entente governments replied to President Wilson's note of December 18. A discussion of this reply will be found in the article *WAR OF THE NATIONS* in the section dealing with diplomatic negotiations relating to the war. On January 17, the State Department received from the British foreign office an additional note, supplementing the general reply of the Allies, and elaborating in detail the position of Great Britain.

The surprise which was occasioned by the president's note of December 18, both in the United States and Europe, was far surpassed by the general astonishment which followed the delivery of an address before the Senate on January 22. This remarkable address declared in effect that, while the United States would gladly join in the international movement to secure the future peace of the world, the basis of peace must be just and lasting, and such that the United States would approve. For a summary of the note see *WAR OF THE NATIONS, The Diplomacy of the War, Peace Proposals*.

The address was warmly praised and sharply criticized. Pacifists of all parties welcomed it as the most important step yet taken toward the end of the war. Opponents of the administration, both in Congress and the country at large, regarded the speech as untimely and dangerous. Criticism in the United States centered on the apparent abandonment of the tradition of diplomatic isolation which was implied in the president's address.

A discussion of the impressions made by the president's suggestions in Europe will be found in the article *WAR OF THE NATIONS*.

**WAR ZONE DECREE.** Discussion of the president's appeals for peace and the practical application of his theories were sharply put to an end on January 31, when Count von Bernstorff, the German Ambassador, delivered an announcement to the State Department, that, since Germany's proffer of peace negotiations had been refused by the Allied governments, the German government "is now compelled to continue the fight for existence, again forced upon it, with the full employment of all the weapons which are at its disposal."

This note was accompanied by a memorandum giving the conditions under which regular passenger steamers might continue undisturbed. Consult *WAR OF THE NATIONS, The Diplomacy of the War, The United States Enters the War*.

Count von Bernstorff also delivered a second memorandum, outlining the reasons for Germany's action. This memorandum was as follows:

"After bluntly refusing Germany's peace offer, the Entente Powers stated in their note addressed to the American government, that they are determined to continue the war in order to deprive Germany of German provinces in the west and east, to destroy Austria-Hungary, and to annihilate Turkey. In waging war with such aims the Entente Allies are violating all rules of international law, as they prevent the legitimate trade of neutrals with the Central Powers, and of the neutrals themselves.

"Germany has, so far, not made unrestricted use of the weapon which she possesses in her submarines. Since the Entente Powers, however, have made it impossible to come to an understanding based upon equality of rights of all nations, as proposed by the Central Powers, and have instead declared only such a peace to be possible which shall be dictated by the Entente Allies and shall result in the destruction and the humiliation of the Central Powers, Germany is unable further to forego the full use of her submarines.

"The Imperial government, therefore, does not doubt that the government of the United States will understand the situation thus forced upon Germany by the Entente Allies' brutal methods of war and by their determination to destroy the Central Powers, and that the government of the United States will further realize that the now openly disclosed intention of the Entente Allies gives back to Germany the freedom of action which she reserved in her note addressed to the government of the United States on May 4, 1916."

The note of May 4 referred to in this memorandum contained a promise on the part of the German government not to sink merchant vessels without warning and without saving human lives unless the ship should attempt to escape or offer resistance. There had been coupled with this declaration a condition that its fulfillment depended upon efforts made on the part of the United States to obtain concessions from Great Britain to modify its war zone policy. In its reply to the German note of May 4, the American government had refused to accept these conditions, or to make its negotiations with Germany in any way dependent upon its negotiations with Great Britain.

In his note of January 31, 1916, Count von Bernstorff added further, that under the circumstances, Germany would meet the illegal measures of her enemies by forcibly preventing all navigation, even that of neutrals, within the specified zone. He added in conclusion: "All ships met within that zone will be sunk. The Imperial government is confident that this measure will result in a speedy termination of the war and in the restoration of peace, which the government of the United States has so much at heart."

**DIPLOMATIC RELATIONS SEVERED.** The president did not delay in this crisis. On February 3 Count von Bernstorff and his official staff were given their passports. On the afternoon of the same day, the president addressed a joint session of Congress. At this historic session, the galleries of the House were crowded with spectators and the president was interrupted several times during the delivery of this address, by hearty applause. The text of the address follows:

Gentlemen of the Congress:

The Imperial German government, on the 31st of January, announced to this government and to the governments of the other neutral nations that on and after the first day of February, the present month, it would adopt a policy with regard to the use of submarines against all shipping seeking to pass through certain designated areas of the high seas to which it is clearly my duty to call your attention.

Let me remind the Congress that on the 18th of April last, in view of the sinking on the 24th of March of the cross-channel passenger steamer *Sussex* by a German submarine, without summons or warning, and the consequent loss of the lives of several citizens of the United States who were passengers aboard her, this government addressed a note to the Imperial German government in which it made the following declaration:

"If it is still the purpose of the Imperial German government to prosecute relentless and indiscriminate warfare against vessels of commerce by the use of submarines without regard to what the government of the United States must consider the sacred and indisputable rules of international law, and the universally recognized dictates of humanity, the government of the United States is at last forced to the conclusion that there is but one course it can pursue. Unless the German government should now immediately declare and effect an abandonment of its present methods of submarine warfare against passenger and freight carrying vessels the government of the United States can have no choice but to sever diplomatic relations with the German Empire altogether."

In reply to this declaration the German government gave this government the following assurances:

"The German government is prepared to do its utmost to confine the operations of war for the rest of its duration to the fighting forces of the belligerents, thereby insuring the freedom of the seas, a principle upon which the German government believes, now as before, to be in agreement with the government of the United States."

"The German government, guided by this idea, notifies the government of the United States that

the German naval forces have received the following orders:

"In accordance with the general principles of visit and search and destruction of merchant vessels recognized by international law, such vessels, both within and without the area declared as naval war zone, shall not be sunk without warning and without saving human lives, unless these ships attempt to escape or offer resistance."

"But neutrals can not expect that Germany, forced to fight for her existence, shall, for the sake of neutral interest, restrict the use of an effective weapon if her enemy is permitted to continue to apply at will methods of warfare violating the rules of international law. Such a demand would be incompatible with the character of neutrality, and the German government is convinced that the government of the United States does not think of making such a demand, knowing that the government of the United States has repeatedly declared that it is determined to restore the principle of the freedom of the seas from whatever quarter it has been violated."

To this the government of the United States replied on the 8th of May, accepting, of course, the assurances given, but adding:

"The government of the United States feels it necessary to state that it takes it for granted that the Imperial German government does not intend to imply that the maintenance of its newly announced policy is in any way contingent upon the course or result of diplomatic negotiations between the government of the United States and any other belligerent government, notwithstanding the fact that certain passages in the Imperial government's note of the 4th instant might appear to be susceptible to that construction. In order, however, to avoid any possible misunderstanding, the government of the United States notifies the Imperial government that it cannot for a moment entertain, much less discuss, a suggestion that respect by German naval authorities for the rights of citizens of the United States upon the high seas should in any way or in the slightest degree be made contingent upon the conduct of any other government affecting the rights of neutrals and non-combatants. Responsibility in such matters is single, not joint; absolute, not relative."

To this note of the 8th of May the Imperial German government made no reply.

On the 31st of January, the Wednesday of the present week, the German Ambassador handed to the secretary of state, along with a formal note, a memorandum which contains the following statement:

"The Imperial government, therefore, does not doubt that the government of the United States will understand the situation thus forced upon Germany by the Entente Allies' brutal methods of war and by their determination to destroy the Central Powers, and that the government of the United States will further realize that the now openly disclosed intentions of the Entente Allies give back to Germany the freedom of action which she reserved in her note addressed to the government of the United States on May 4, 1916."

"Under these circumstances Germany will meet the illegal measures of her enemies by forcibly preventing after February 1, 1917, in a zone around Great Britain, France, Italy, and in the eastern Mediterranean all navigation, that of neutrals included, from and to France, etc. All ships met within the zone will be sunk."

I think that you will agree with me that, in view of this declaration, which suddenly and without prior intimation of any kind deliberately withdraws the solemn assurance given in the Imperial government's note of the fourth of May, 1916, this government has no alternative consistent with the dignity and honor of the United States but to take the course which, in its note of the 18th of April, 1916, it announced that it would take in the event that the German government did not declare and effect an abandonment of the methods of submarine warfare which it was then employing and to which it now purposes again to resort.

I have, therefore, directed the secretary of state to announce to his excellency the German Ambassador that all diplomatic relations between the United States and the German Empire are severed, and that the American Ambassador at Berlin will immediately be withdrawn, and, in accordance with this decision, to hand to his excellency his passports.

Notwithstanding this unexpected action of the German government, this sudden and deeply deplorable renunciation of its assurances, given this government at one of the most critical moments of tension in the relation of the two governments, I refuse to believe that it is the intention of the

German authorities to do in fact what they have warned us they will feel at liberty to do. I cannot bring myself to believe that they will indeed pay no regard to the ancient friendship between their people and our own or to the solemn obligations which have been exchanged between them and destroy American ships and take the lives of American citizens in the willful prosecution of the ruthless naval programme they have announced their intention to adopt.

Only actual overt acts on their part can make me believe it even now.

If this inveterate confidence on my part in the sobriety and prudent foresight of their purpose should unhappily prove unfounded, if American ships and American lives should in fact be sacrificed by their naval commanders in heedless contravention of the just and reasonable understandings of international law and the obvious dictates of humanity, I shall take the liberty of coming again before the Congress to ask that authority be given me to use any means that may be necessary for the protection of our seamen and our people in the prosecution of their peaceful and legitimate errands on the high seas. I can do nothing less. I take it for granted that all neutral governments will take the same course.

I do not desire any hostile conflict with the Imperial German government. We are the sincere friends of the German people and earnestly desire to remain at peace with the government which speaks for them. We shall not believe that they are hostile to us until we are obliged to believe it; and we purpose nothing more than the reasonable defense of the undoubted rights of our people. We wish to serve no selfish ends. We seek merely to stand true alike in thought and in action to the immemorial principles of our people which I sought to express in my address to the Senate only two weeks ago—seek merely to vindicate our right to liberty and justice and an unmolested life. These are bases of peace, not war. God grant we may not be challenged to defend them by acts of willful injustice on the part of the government of Germany!

**THE COUNTRY AROUSED.** The president's action was universally and enthusiastically commended. To a large portion of the people there came with it a sense of relief at the termination of the intolerable situation, resulting from the efforts of the country to maintain a position of neutrality in the face of continued outbreaks on the part of Germany, and an almost general sympathy with the cause of the Allies. The governors of many States at once sent messages to the president assuring him that he would receive their hearty and undivided support. The president's stand was approved by his predecessor, Mr. Taft, and his recent rival for the presidency, Mr. Hughes.

Colonel Roosevelt at once volunteered to raise a division of troops, if war should be declared, and announced his intention of going to the front with his four sons. William J. Bryan was the only prominent opponent of the policy of maintaining American rights at sea if necessary by war. He suggested a postponement of the question until after the end of the war. He also declared that Americans should be forbidden to travel on belligerent ships, and that American ships should be forbidden to enter the war zone. He favored the submission of the question of war or peace to a popular referendum.

In Congress the support of the president was practically unanimous. Attention was at once given to the consideration of measures already introduced imposing heavy penalties on persons guilty of offenses against the neutrality of the United States.

In the harbors of the country, especially in New York and Boston, there had been interned, since the outbreak of the war, a large number of German merchant ships, including several of

the largest vessels in commission. Possession was at once taken of these vessels by the American authorities not, however, in many cases, before they had been seriously damaged by their former crews under orders from the German government (see below).

The government authorities took charge of the wireless station at Sayville, Long Island, which, during the war, had been the most important means of rapid communication between Germany and the United States. All diplomatic representatives from Germany, including consuls and consul's agents, were directed to return home at once.

Measures were at once taken by all the government agencies to prepare for the war which seemed now inevitable. The Council of National Defense took up plans for the mobilization of the industrial resources of the country, and to consider the offers of many manufacturers who had placed their plants at the disposal of the government. The Naval Consulting Board, under the presidency of Thomas A. Edison, began the consideration of new methods of dealing with submarines. Efforts to enlist 25,000 recruits for the navy were at once begun. The president and his cabinet began the preparation of measures to be introduced into Congress to meet the emergency.

The State Department forwarded to the American representatives in neutral countries the announcement of the severance of diplomatic relations with Germany, adding these instructions: "Say also that the president is reluctant to believe that Germany actually will carry out her threats against neutral commerce, but, if it be done, the president will ask Congress to authorize the use of the national power to protect American citizens engaged in their peaceful and lawful errands on the sea. He believes it will make for the peace of the world if other neutral powers may find it possible to take similar action."

The Senate, on February 7, passed a resolution, by a vote of 78 to 5, approving "the action taken by the president as set forth in his address delivered before the joint session of Congress." See UNITED STATES.

On the same day in which this resolution was passed the first passenger steamer, since the promulgation of the German edict, fell a victim to the German blockade about the British Islands. This was the steamer *California*, of the Anchor Line, on her way from New York to Glasgow. She was hit by a torpedo and from the explosion which followed five persons were killed, thirty-six others were drowned, including three women and two children.

**GERMAN-AMERICAN ATTITUDE.** The attitude of the German-Americans in this crisis had been awaited with some anxiety. As a class these men were emphatic in expressing their determination to uphold the hands of the American government. The German-American National Alliance at a meeting of delegates from twenty-eight States held in Philadelphia, adopted resolutions, pledging loyalty to the government in peace and war. There was also a rush of applicants for naturalization on the part of these residents. Certain conspicuous members of the German-American Alliance, however, identified themselves with the pacifists, and favored submitting the question of war to a national referendum.

Samuel Gompers, president of the American Federation of Labor, promised that the members and officials of the federation would be united in the support of the government. Woman suffrage organizations also offered their services in any fields where they might be found useful. In the colleges and universities throughout the country the training of students for the various branches of the military and naval service was at once begun.

**A PERIOD OF WAITING.** The tension which followed the severance of diplomatic relations increased as the days went on. On the same day on which diplomatic relations were severed, the American steamship *Housatonic* was sunk by a German submarine, after warning had been given. All on board were saved. Following the destruction of the *California*, came the loss of two British steamers, the *Japanese Prince* and the *Montola*, which were sunk without warning by a German submarine. On board the *Japanese Prince* were thirty American cattlemen who were all saved. On board the *Montola* was an American doctor. The *Lyman M. Law*, an American sailing vessel loaded with lumber, on her way from Maine to Italy, was sunk by a submarine off the coast of Sardinia. Seven of the crew were Americans. The attack was made without warning, and, after the crew had left, a bomb was placed on board and the ship was destroyed. Much more serious was the destruction, on February 25, of the Cunard liner *Laconia*, which was torpedoed in the Irish Sea at night. Three American passengers, two of whom were women, died from exposure in an open boat while the survivors were making their way toward shore. While public feeling grew more intense day by day, the president remained silent. Germany, in the meantime, made tentative proposals through the Swiss minister to reopen negotiations with the American government. An account of these efforts will be found in *WAR OF THE NATIONS, Diplomacy of the War*. It may be noted here, however, that these overtures were bluntly refused by the secretary of state.

As we have already noted, upon the rupture of diplomatic relations, the State Department notified Ambassador Gerard in Berlin to ask for his passports. At this time Mr. Gerard was occupied in negotiating with the German government for the release of sixty-two American prisoners taken from ships sunk by a German raider in the South Atlantic, and taken to a German port on one of the captured vessels, the British steamer *Yarrowdale*. As these men were neutrals Germany had no right to hold them. The German government, however, undertook to take advantage of the situation to obtain concessions from the American government. Ambassador Gerard, in the days immediately following the severance of relations, was subjected to many indignities by the German authorities. His mail was intercepted, his telephone cut off, and telegraphic facilities denied him. Efforts were made also to force him to sign a protocol revising the treaties of 1799 and 1828 with the effect of protecting Germans and their interests in the United States in the event of war. See *WAR OF THE NATIONS*, section on *The Diplomacy of the War*.

Mr. Gerard was finally permitted to leave Berlin on February 10. American affairs in Germany were placed in the hands of the Span-

ish Ambassador. On February 14 Count von Bernstorff sailed for Germany on a Danish steamer, guarantees having been obtained from the Allied countries that he would have safe conduct.

The *Yarrowdale* prisoners, after various delays, were finally released on March 8, 1917. The reason for their detention, as given by the German officials, was the desire to ascertain the attitude to be taken toward German subjects in the United States.

**ARMED NEUTRALITY.** The president broke silence on February 26, by appearing again before Congress in joint session, and asking for authority to use the armed forces of the United States to protect American rights on the seas. Effect was added to his appeal by the fact that news was received, while the president was on his way to the capitol, of the destruction of the *Laconia*, mentioned above. The text of the president's message is as follows:

Gentlemen of the Congress: I have again asked the privilege of addressing you because we are moving through critical times during which it seems to me to be my duty to keep in close touch with the houses of Congress, so that neither counsel nor action shall run at cross purposes between us.

On the 3d of February I officially informed you of the sudden and unexpected action of the Imperial German government in declaring its intention to disregard the promises it had made to this government in April last and undertake immediate submarine operations against all commerce, whether of belligerents or of neutrals, that should seek to approach Great Britain and Ireland, the Atlantic coasts of Europe, or the harbors of the eastern Mediterranean, and to conduct these operations without regard to the established restrictions of international practice, without regard to any considerations of humanity, even, which might interfere with their object. That policy was forthwith put into practice. It has now been in active execution for nearly four weeks.

Its practical results are not yet fully disclosed. The commerce of other neutral nations is suffering severely, but not, perhaps, very much more severely than it was already suffering before the 1st of February, when the new policy of the Imperial government was put into operation. We have asked the coöperation of the other neutral governments to prevent these depredations, but so far none of them has thought it wise to join us in any common course of action. Our own commerce has suffered is suffering, rather in apprehension than in fact, rather because so many of our ships are timidly keeping to their home ports than because American ships have been sunk.

Two American vessels have been sunk, the *Housatonic* and the *Lyman M. Law*. The case of the *Housatonic*, which was carrying foodstuffs consigned to a London firm, was essentially like the case of the *Frye*, in which, it will be recalled, the German government admitted its liability for damages, and the lives of the crew, as in the case of the *Frye*, were safeguarded with reasonable care. The case of the *Law*, which was carrying lemon box staves to Palermo, disclosed a ruthlessness of method which deserves grave condemnation, but was accompanied by no circumstances which might not have been expected at any time in connection with the use of the submarine against merchantmen as the German government has used it.

In sum, therefore, the situation we find ourselves in with regard to the actual conduct of the German submarine warfare against commerce and its effects upon our own ships and people is substantially the same that it was when I addressed you on the 3d of February, except for the tying up of our shipping in our own ports because of the unwillingness of our shipowners to risk their vessels at sea without insurance or adequate protection, and the very serious congestion of our commerce which has resulted, a congestion which is growing rapidly more and more serious every day. This in itself might presently accomplish, in effect, what the new German submarine orders were meant to accomplish, so far as we are concerned.

We can only say, therefore, that the overt act which I have ventured to hope the German commanders would in fact avoid has not occurred.

But while this is happily true, it must be admitted that there have been certain additional indications and expressions of purpose on the part of the German press and the German authorities which have increased rather than lessened the impression that, if our ships and our people are spared, it will be because of fortunate circumstances or because the commanders of the German submarines which they may happen to encounter exercise an unexpected discretion and restraint rather than because of the instructions under which those commanders are acting. It would be foolish to deny that the situation is fraught with the gravest possibilities and dangers. No thoughtful man can fail to see that the necessity for definite action may come at any time, if we are in fact and not in word merely to defend our elementary rights as a neutral nation. It would be most imprudent to be unprepared.

I cannot in such circumstances be unmindful of the fact that the expiration of the term of the present Congress is immediately at hand, by constitutional limitation; and that it would in all likelihood require an unusual length of time to assemble and organize the Congress which is to succeed it. I feel that I ought, in view of the fact, to obtain from you full and immediate assurance of the authority which I may need at any moment to exercise. No doubt I already possess that authority without special warrant of law, by the plain implication of my constitutional duties and powers; but I prefer, in the present circumstances, not to act upon general implication. I wish to feel that the authority and the power of the Congress are behind me in whatever it may become necessary for me to do. We are jointly the servants of the people and must act together and in their spirit, so far as we can divine and interpret it.

No one doubts what it is our duty to do. We must defend our commerce and the lives of our people in the midst of the present trying circumstances, with discretion but with clear and steadfast purpose. Only the method and the extent remain to be chosen, upon the occasion, if occasion should indeed arise. Since it has unhappily proved impossible to safeguard our neutral right by diplomatic means against the unwarranted infringements they are suffering at the hands of Germany, there may be no recourse but to armed neutrality, which we shall know how to maintain and for which there is abundant American precedent.

It is devoutly to be hoped that it will not be necessary to put armed force anywhere into action. The American people do not desire it and our desire is not different from theirs. I am sure that they will understand the spirit in which I am now acting, the purpose I hold nearest my heart, and would wish to exhibit in everything I do. I am anxious that the people of the nations at war also should understand and not mistrust us. I hope that I need give no further proofs and assurances that I have already given throughout nearly three years of anxious patience that I am the friend of peace and mean to preserve it for America so long as I am able.

I am not now proposing or contemplating war or any steps that need lead to it. I merely request that you will accord me by your own vote and definite bestowal the means and the authority to safeguard in practice the right of a great people who are at peace and who are desirous of exercising none but the rights of peace to follow the pursuits of peace in quietness and good will—rights recognized time out of mind by all the civilized nations of the world. No course of my choosing or of theirs will lead to war. War can come only by the willful acts and aggressions of others.

You will understand why I can make no definite proposals or forecasts of action now, and must ask for your supporting authority in the most general terms. The form in which action may become necessary cannot yet be foreseen. I believe that the people will be willing to trust me to act with restraint, with prudence, and in the true spirit of amity and good faith that they have themselves displayed throughout these trying months, and it is in that belief that I request that you will authorize me to supply our merchant ships with defensive arms should that become necessary, and with the means of using them, and to employ any other instrumentalities or methods that may be necessary and adequate to protect our ships and our people in their legitimate and peaceful pursuits on the seas.

I request also that you will grant me, at the same time, along with the powers I ask, a sufficient credit to enable me to provide adequate means of protection where they are lacking, including adequate insurance against the present war risks.

I have spoken of our commerce and of the legitimate errands of our people on the seas, but you

will not be misled as to my main thought, the thought that lies beneath these phrases and gives them dignity and weight. It is not of material interest merely that we are thinking. It is, rather, of fundamental human rights, chief of all the right of life itself. I am thinking not only of the rights of Americans to go and come about their proper business by way of the sea, but also of something much deeper, much more fundamental than that. I am thinking of those rights of humanity without which there is no civilization.

My theme is of those great principles of compassion and of protection which mankind has sought to throw about human lives, the lives of non-combatants, the lives of men who are peacefully at work keeping the industrial processes of the world quick and vital, the lives of women and children and of those who supply the labor which ministers to their sustenance.

We are speaking of no selfish material rights, but of rights which our hearts support and whose foundation is that righteous passion for justice upon which all law, all structures alike of family, of state, and of mankind, must rest, as upon the ultimate base of our existence and our liberty. I cannot imagine any man with American principles at his heart hesitating to defend these things.

**OPPOSITION IN CONGRESS.** Immediately following the request of the president, the Senate and the House set about framing bills to put it into effect. Congress expired on March 4, 1917, and there remained only eight days in which to debate and agree to a measure which was certainly to be strongly opposed by the pacifist element in Congress. In the House, this opposition did not assume formidable proportion. The Armed Ship Bill was reported in that body by the Foreign Affairs Committee. On February 28 and 29 debate was carried on. The bill was passed before adjournment by a vote of 403 to 13. It was at once sent to the Senate, and was substituted for the bill prepared by the Senate Committee on Foreign Affairs whose provisions conferred larger powers upon the president. Debate on the bill began in the Senate on March 1.

Senator La Follette, of Wisconsin, objected to its consideration, and would permit the debate to be carried on, only on condition that no attempt would be made to pass the bill before the next day. Thus a day was lost, and this sealed the fate of the measure. It was debated continuously on March 2, 1917, and debate was resumed on the following day. Senator Stone, chairman of the Committee on Foreign Relations, was opposed to the bill, and he proposed an amendment excluding munition ships from armed protection. The chief obstruction to the bill, however, came from a group of Senators representing chiefly western States who prevented every effort made for limiting debate or setting a time for voting. When the supporters of the bill understood that there was no possibility of its passage, they signed a manifesto reading as follows: "The undersigned United States Senators favor the passage of Senate bill 8322, to authorize the President of the United States to arm American merchant vessels. A similar bill already has passed the House by a vote of 403 to 13. Under the rules of the Senate, allowing unlimited debate, it now appears to be impossible to obtain a vote prior to noon, March 4, 1917, when the session of the Congress expires. We desire the statement entered in the record to establish the fact that the Senate favors the legislation and would pass if a vote could be obtained." This manifesto was signed by seventy-five Senators. The Senate continued in session until twelve o'clock noon on March 4, 1917, when

it automatically adjourned, the session having expired. The twelve Senators who prevented the passage of the bill were La Follette of Wisconsin, Norris of Nebraska, Cummins of Iowa, Kenyon of Iowa, Stone of Missouri, Gronna of North Dakota, Kirby of Arkansas, Vardaman of Mississippi, O'Gorman of New York, Works of California, Clapp of Minnesota, and Lane of Oregon; seven Republicans and five Democrats.

The situation brought from the president the indignant protest in the form of a public statement in which he denounced the actions of the twelve Senators, and called for a revision of the rules of the Senate, which would prevent a repetition of the performance.

**GERMANY AND MEXICO.** While the discussion of this bill was being carried on in Congress, the nation was suddenly startled by the publication of a note from the German foreign minister to the German ambassador in Mexico. This document, which was dated January 19, 1917, announced to the latter official that submarine warfare would be resumed and directed him to propose to the Mexican government an alliance with Germany against the United States. For discussion of this episode see the article *WAR OF THE NATIONS, The Diplomacy of the War.*

**ARMING OF MERCHANT SHIPS.** Although the president's efforts to receive authority from Congress for arming merchant ships failed, he was able to accomplish his purposes in another way. An act passed in 1819 governing piracy at sea was held by the advisers of the president to give the required authority. This statute forbade American merchant men to defend themselves against commissioned vessels of a nation with which the United States was at "amity"; but they could resist by force any attacks made on them by other armed vessels. In other words, this legalized resistance to pirates. It was held that Germany's denial to Americans of the rights of the high seas was inconsistent with true amity, and caused her war vessels to lose, so far as the United States was concerned, their right to immunity from attack, both under international law and under the law of 1819. The president, as commander-in-chief of the army and navy, thereupon determined to order the armament of merchant vessels in so far as they desired to be armed. The following memorandum was thereupon dispatched to the foreign governments:

"In view of the announcement of the Imperial German government on January 31, 1917, that all ships, those of neutrals included, met within certain zones of the high seas, would be sunk without any precaution taken for the safety of the persons on board, and without the exercise of visit and search, the government of the United States has determined to place upon all American merchant vessels sailing through the barred areas an armed guard for the protection of the vessels and the lives of the persons on board."

In the meantime, the Senate of the Sixty-fourth Congress remained in executive session in order to devise a means of preventing a repetition of the situation which had prevented the passage of the Armed Merchant Bill. See *UNITED STATES, Sixty-Fifth Congress, Special Session.*

The president was inaugurated for his second term on March 4, 1917. His inaugural address was given up mainly to the consideration of the situation as relates to Germany.

President Wilson, on March 9, issued a call for a session of the Sixty-fifth Congress to assemble on April 16 for the purpose of passing appropriation measures and other bills necessary to prepare for the inevitable event.

German submarines continued to fire upon and sink American vessels and vessels which had Americans aboard. On March 12, 1917, the unarmed steamer *Algonquin*, with a crew of 27 men, of whom 10 were Americans, was sunk without warning by a German submarine. Two days later three unarmed vessels, the *City of Memphis*, *Illinois*, and *Vigilencia*, were destroyed.

It was obvious that a state of armed neutrality was inadequate to meet the serious situation. The president was confronted with the necessity of immediately taking more drastic action rather than continuing to pursue measures of passive defense. At a Cabinet meeting on March 20 further action was discussed, and on the following day the president issued a proclamation calling upon Congress to assemble on April 2 instead of April 16 "to receive a communication concerning grave matters of national policy."

In the meantime, preparations were steadily going forward. The Secretary of War made a contract with manufacturers for military supplies even although such expenditures had not been authorized by Congress. On March 25 the president called for the Federal service of fourteen National Guard regiments from the eastern States. Several of these States had already put their militia on a war footing. The purpose of this mobilization was to protect munition plants, bridges, railways, and other endangered property from any violations that might arise from the present international crisis. There were also organized two new departments of the regular army, the northeastern, comprising the New England States, and the southeastern, including the southern States east of the Mississippi.

Each day the government received more emphatic assurance of support from State legislatures, governors, and members of Congress. At a rally in Madison Square in New York City, resolutions were adopted urging an immediate declaration of war and the enactment of universal military service. Elihu Root was the principal speaker.

There were many proofs of the activities of German agents, especially in an effort to use the territory of the United States as a basis for conspirators against the Allies. In Hoboken, N. J., two Germans, Fritz Kolb and Hans Schwartz, were arrested for storing powerful explosives with the apparent intention of wrecking munition plants. In Galveston, Texas, bombs were discovered on board a grain ship and in a grain elevator. There was discovered in Philadelphia a plot in which the president of the Machine Manufacturing Company, which had performed contracts for the American navy, had conspired with the captains of interned commerce raiders in the port, to obtain and transmit to Germany secret information in regard to the American navy. See also section on *German Intrigues.*

**DECLARATION OF WAR.** On the appointed date, April 2, 1917, President Wilson appeared before the joint session of Congress, at 8:35 in the evening, and asked for authority to declare

war against Germany. This historic address follows:

I have called the Congress into extraordinary session because there are serious—very serious—choices of policy to be made, and made immediately, which it was neither right nor constitutionally permissible that I should assume the responsibility of making.

On the third of February last I officially laid before you the extraordinary announcement of the Imperial German government that on and after the first day of February it was its purpose to put aside all restraints of law or of humanity and use its submarines to sink every vessel that sought to approach either the ports of Great Britain and Ireland or the western coasts of Europe, or any of the ports controlled by the enemies of Germany within the Mediterranean.

That had seemed to be the object of the German submarine warfare earlier in the war, but since April of last year the Imperial German government had somewhat restrained the commanders of its under sea craft in conformity with its promise then given to us that passenger boats should not be sunk and that due warning would be given to all other vessels which its submarines might seek to destroy, when no resistance was offered or escape attempted, and care taken that their crews were given at least a fair chance to save their lives in their open boats.

The precautions taken were meagre and haphazard enough, as was proved in distressing instance after instance in the progress of the cruel and unmanly business, but a certain degree of restraint was observed.

The new policy has swept every restriction aside. Vessels of every kind, whatever their flag, their character, their cargo, their destination, their errand, have been ruthlessly sent to the bottom without warning and without thought of help or mercy for those on board, the vessels of friendly neutrals along with those of belligerents.

Even hospital ships and ships carrying relief to the sorely bereaved and stricken people of Belgium, though the latter were provided with safe conduct through the proscribed areas by the German government itself and were distinguished by unmistakable marks of identity, have been sunk with the same reckless lack of compassion or of principle.

International law had its origin in the attempt to set up some law, which would be respected and observed upon the seas, where no nation had right of dominion and where lay the free highways of the world.

By painful stage after stage has that law been built up, with meagre enough results, indeed, after all was accomplished that could be accomplished, but always with a clear view, at least, of what the heart and conscience of mankind demanded.

This minimum of right the German government has swept aside under the plea of retaliation and necessity, and because it had no weapons which it could use at sea except these, which it is impossible to employ, as it is employing them, without throwing to the winds all scruples of humanity or of respect for the understandings that were supposed to underlie the intercourse of the world.

I am not now thinking of the loss of property involved, immense and serious as that is, but only of the wanton and wholesale destruction of the lives of non-combatants—men, women, and children—engaged in pursuits which have always, even in the darkest periods of modern history, been deemed innocent and legitimate. Property can be paid for; the lives of peaceful and innocent people cannot be.

The present German warfare against commerce is a warfare against mankind. It is a war against all nations. American ships have been sunk, American lives taken, in ways which it has stirred us very deeply to learn of; but the ships and people of other neutral and friendly nations have been sunk and overwhelmed in the waters in the same way.

There has been no discrimination. The challenge is to all mankind. Each nation must decide for itself how it will meet it. The choice we make for ourselves must be made with a moderation of counsel and a temperateness of judgment befitting our character and our motives as a nation. We must put excited feeling away. Our motive will not be revenge or the victorious assertion of the physical might of the nation, but only the vindication of right, of human right, of which we are only a single champion.

When I addressed the Congress on the twenty-sixth of February last I thought that it would

suffice to assert our neutral rights with arms, our right to use the seas against unlawful interference, our right to keep our people safe against unlawful violence.

But armed neutrality, it now appears, is impracticable. Because submarines have been used against merchant shipping it is impossible to defend ships against their attacks, as the law of nations has assumed that merchantmen would defend themselves against privateers or cruisers, visible craft, giving chase upon the open sea.

It is common prudence in such circumstances, grim necessity indeed, to destroy them before they have shown their own intention. They must be dealt with upon sight, if dealt with at all.

The German government denies the right of neutrals to use arms at all within the areas of the sea which it has prohibited even in the defense of rights which no modern publicist has ever before questioned their right to defend.

The intimation is conveyed that the armed guards which we have placed on our merchant ships will be treated as beyond the pale of law and subject to be dealt with as pirates would be. Armed neutrality is ineffectual enough at best. In such circumstances and in the face of such pretensions it is worse than ineffectual. It is likely only to produce what it was meant to prevent. It is practically certain to draw us into the war without either the rights or the effectiveness of belligerents.

There is one choice we cannot make, we are incapable of making: We will not choose the path of submission and suffer the most sacred rights of our nation and our people to be ignored or violated. The wrongs against which we now array ourselves are not common wrongs; they cut to the very roots of human life.

With a profound sense of the solemn and even tragical character of the step I am taking and of the grave responsibilities which it involves, but in unhesitating obedience to what I deem my constitutional duty, I advise that the Congress declare the recent course of the Imperial German government to be in fact nothing less than war against the government and people of the United States; that it formally accept the status of belligerent which has thus been thrust upon it and that it take immediate steps not only to put the country in a more thorough state of defense, but also to exert all its power and employ all its resources to bring the government of the German Empire to terms and end the war.

What this will involve is clear. It will involve the utmost practicable coöperation in counsel and action with the governments now at war with Germany, and, as incident to that, the extension to those governments of the most liberal financial credits, in order that our resources may, so far as possible, be added to theirs. It will involve the organization and mobilization of all the material resources of the country to supply the materials of war and serve the incidental needs of the nation in the most abundant, and yet the most economical and efficient, way possible.

It will involve the immediate full equipment of the navy in all respects, but particularly in supplying it with the best means of dealing with the enemy's submarines. It will involve the immediate addition to the armed forces of the United States, already provided for by law in case of war, of at least 500,000 men, who should, in my opinion, be chosen upon the principle of universal liability to service, and also the authorization of subsequent additional increments of equal force so soon as they may be needed and can be handled in training.

It will involve also, of course, the granting of adequate credits to the government, sustained, I hope, so far as they can equitably be sustained by the present generation, by well conceived taxation. I say sustained so far as may be equitable by taxation because it seems to me that it would be most unwise to base the credits which will now be necessary entirely on money borrowed. It is our duty, I most respectfully urge, to protect our people so far as we may against the very serious hardships and evils which would be likely to arise out of the inflation which would be produced by vast loans.

In carrying out the measures by which these things are to be accomplished we should keep constantly in mind the wisdom of interfering as little as possible in our own preparation and in the equipment of our own military forces with the duty—for it will be a very practical duty—of supplying the nations already at war with Germany with the materials which they can obtain only from us or by our assistance. They are in the

field and we should help them in every way to be effective there.

I shall take the liberty of suggesting, through the several executive departments of the government for the consideration of your committees, measures for the accomplishment of the several objects I have mentioned. I hope that it will be your pleasure to deal with them as having been framed after very careful thought by the branch of the government upon which the responsibility of conducting the war and safeguarding the nation will most directly fall.

While we do these things, these deeply momentous things, let us be very clear, and make very clear to all the world what our motives and our objects are. My own thought has not been driven from its habitual and normal course by the unhappy events of the last two months, and I do not believe that the thought of the nation has been altered or clouded by them.

I have exactly the same thing in mind now that I had in mind when I addressed the Senate on the 22d of January last; the same that I had in mind when I addressed the Congress on the 3d of February and on the 26th of February. Our object now, as then, is to vindicate the principles of peace and justice in the life of the world as against selfish and autocratic power and to set up amongst the really free and self-governed peoples of the world such a concert of purpose and of action as will henceforth insure the observance of those principles.

Neutrality is no longer feasible or desirable where the peace of the world is involved and the freedom of its peoples, and the menace to that peace and freedom lies in the existence of autocratic governments backed by organized force, which is controlled wholly by their will, not by the will of their people. We have seen the last of neutrality in such circumstances.

We are at the beginning of an age in which it will be insisted that the same standards of conduct and of responsibility for wrong done shall be observed among nations and their governments that are observed among the individual citizens of civilized states.

We have no quarrel with the German people. We have no feeling toward them but one of sympathy and friendship. It was not upon their impulse that their government acted in entering this war. It was not with their previous knowledge or approval.

It was a war determined upon as wars used to be determined upon in the old, unhappy days when peoples were nowhere consulted by their rulers and wars were provoked and waged in the interest of dynasties or of little groups of ambitious men who were accustomed to use their fellow men as pawns and tools.

Self-governed nations do not fill their neighbor states with spies or set the course of intrigue to bring about some critical posture of affairs which will give them an opportunity to strike and make conquest. Such designs can be successfully worked only under cover and where no one has the right to ask questions.

Cunningly contrived plans of deception or aggression, carried, it may be, from generation to generation, can be worked out and kept from the light only within the privacy of courts or behind the carefully guarded confidences of a narrow and privileged class. They are happily impossible where public opinion commands and insists upon full information concerning all the nation's affairs.

A steadfast concert for peace can never be maintained except by a partnership of democratic nations. No autocratic government could be trusted to keep faith within it or observe its covenants. It must be a league of honor, a partnership of opinion. Intrigue would eat its vitals away, the plottings of inner circles would be a corruption seated at its very heart. Only free peoples who could plan what they would and render account to no one can hold their purpose and their honor steady to a common end and prefer the interests of mankind to any narrow interest of their own.

Does not every American feel that assurance has been added to our hope for the future peace of the world by the wonderful and heartening things that have been happening within the last few weeks in Russia?

Russia was known by those who knew it best to have been always in fact democratic at heart, in all the vital habits of her thought, in all the intimate relationships of her people that spoke their natural instinct, their habitual attitude toward life.

Autocracy that crowned the summit of her political structure, long as it has stood and terrible as was the reality of its power, was not in fact Russian in origin, in character or purpose, and now

it has been shaken and the great, generous Russian people have been added in all their native majesty and might to the forces that are fighting for freedom in the world, for justice, and for peace.

Here is a fit partner for a league of honor.

One of the things that has served to convince us that the Prussian autocracy was not and could never be our friend is that from the very outset of the present war it has filled our unsuspecting communities and even our offices of government with spies and set criminal intrigues everywhere afoot against our national unity of council, our peace within and without, our industries and our commerce.

Indeed it is now evident that its spies were here even before the war began, and it is unhappily not a matter of conjecture but a fact proved in our courts of justice that the intrigues which have more than once come perilously near to disturbing the peace and dislocating the industries of the country have been carried on at the instigation, with the support, and even under the personal direction of official agents of the Imperial government accredited to the government of the United States.

Even in checking these things and trying to extirpate them we have sought to put the most generous interpretation possible upon them because we knew that their source lay, not in any hostile feeling or purpose of the German people toward us (who were, no doubt, as ignorant of them as we ourselves were) but only in the selfish designs of a government that did what it pleased and told its people nothing. But they have played their part in serving to convince us at last that that government entertains no real friendship for us and means to act against our peace and security at its convenience. That it means to stir up enemies against us at our very doors the intercepted note to the German Minister at Mexico City is eloquent evidence.

We are accepting this challenge of hostile purpose because we know that in such a government, following such methods, we can never have a friend; and that in the presence of its organized power, always lying in wait to accomplish we know not what purpose, there can be no assured security for the democratic governments of the world.

We are now about to accept gauge of battle with this natural foe to liberty, and shall, if necessary, spend the whole force of the nation to check and nullify its pretensions and its power. We are glad, now that we see the facts with no veil of false pretense about them, to fight thus for the ultimate peace of the world and for the liberation of its peoples—the German people included—for the rights of nations great and small and the privilege of men everywhere to choose their way of life and of obedience.

The world must be made safe for democracy. Its peace must be planted upon the trusted foundations of political liberty.

We have no selfish ends to serve. We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make. We are but one of the champions of the rights of mankind. We shall be satisfied when those rights have been made as secure as the faith and the freedom of the nation can make them.

Just because we fight without rancor and without selfish objects, seeking nothing for ourselves but what we shall wish to share with all free peoples, we shall, I feel confident, conduct our operations as belligerents without passion and ourselves observe with proud punctilio the principles of right and of fair play we profess to be fighting for.

I have said nothing of the governments allied with the Imperial government of Germany because they have not made war upon us or challenged us to defend our right and our honor.

The Austro-Hungarian government has, indeed, avowed its unqualified indorsement and acceptance of the reckless and lawless submarine warfare adopted now without disguise by the Imperial German government, and it has therefore not been possible for this government to receive Count Tarnowski, the Ambassador recently accredited to this government by the Imperial and Royal government of Austria-Hungary; but that government has not actually engaged in warfare against citizens of the United States on the seas, and I take the liberty, for the present at least, of postponing a discussion of our relations with the authorities at Vienna.

We enter this war only where we are clearly

forced into it because there are no other means of defending our rights.

It will be all the easier for us to conduct ourselves as belligerents in a high spirit of right and fairness because we act without animus, not in enmity toward a people or with the desire to bring any injury or disadvantage upon them, but only in armed opposition to an irresponsible government which has thrown aside all considerations of humanity and of right and is running amuck.

We are, let me say again, the sincere friends of the German people, and shall desire nothing so much as the early reestablishment of intimate relations of mutual advantage between us—however hard it may be for them, for the time being, to believe that this is spoken from our hearts.

We have borne with their present government through all these bitter months because of that friendship—exercising a patience and forbearance which would otherwise have been impossible. We shall, happily, still have an opportunity to prove that friendship in our daily attitude and actions toward the millions of men and women of German birth and native sympathy who live amongst us and share our life, and we shall be proud to prove it toward all who are in fact loyal to their neighbors and to the government in the hour of test. They are, most of them, as true and loyal Americans as if they had never known any other fealty or allegiance. They will be prompt to stand with us in rebuking and restraining the few who may be of a different mind and purpose.

If there should be disloyalty, it will be dealt with with a firm hand of stern repression; but, if it lifts its head at all, it will lift it only here and there and without countenance except from a lawless and malignant few.

It is a distressing and oppressive duty, gentlemen of the Congress, which I have performed in thus addressing you. There are, it may be, many months of fiery trial and sacrifice ahead of us. It is a fearful thing to lead this great peaceful people into war, into the most terrible and disastrous of all wars, civilization itself seeming to be in the balance. But the right is more precious than peace, and we shall fight for the things which we have always carried nearest our hearts—for democracy, for the right of those who submit to authority to have a voice in their own governments, for the rights and liberties of small nations, for a universal dominion of right by such a concert of free peoples as shall bring peace and safety to all nations and make the world itself at last free.

To such a task we can dedicate our lives and our fortunes, everything that we are and everything that we have, with the pride of those who know that the day has come when America is privileged to spend her blood and her might for the principles that gave her birth and happiness and the peace which she has treasured. God helping her, she can do no other.

The president was many times interrupted with applause during the delivery of the address. On the following day the Foreign Affairs Committee of both Houses met to consider war resolutions introduced immediately after the president's address. The resolution finally submitted was as follows:

"WHEREAS, The Imperial German government has committed repeated acts of war against the government and the people of the United States of America, therefore be it

"RESOLVED, By the Senate and House of Representatives of the United States of America in Congress assembled, that the state of war between the United States and the Imperial German government, which has thus been thrust upon the United States, is hereby formally declared and that the president be, as he is hereby, authorized and directed to employ the entire naval and military forces of the United States and the resources of the government to carry on war against the Imperial German government; and, to bring the conflict to a successful termination, all of the resources of the country are hereby pledged by the Congress of the United States."

In the Senate, where it had been introduced, its adoption was opposed by Senator Stone, chairman of the Foreign Relations Committee, and by Senator La Follette, who insisted on the regular order, letting it lay over for one day. On April 4, the Senate met with the intention

of passing the resolution before adjournment. A debate continued until 11 o'clock at night, and was finally passed by a vote of 86 to 6. Those who opposed it were La Follette of Wisconsin, Gronna of North Dakota, Norris of Nebraska, Stone of Missouri, Lane of Oregon, and Vardaman of Mississippi. These were all included in the original group of twelve who had prevented a vote on the Armed Ship Bill. Three of this group, O'Gorman, Clapp, and Works did not return to the Senate. Three others abandoned their former opposition and voted for the resolution. The resolution was at once taken to the House, where, after a debate which continued until the early morning of April 6, it was passed by a vote of 373 to 50. The president signed the resolution in the afternoon of the same day. At the same time he issued a proclamation notifying the world that a state of war existed between the United States and Germany, and outlining regulations of the conduct of alien enemies resident within American jurisdiction.

Although the declaration of war referred only to Germany, Austria-Hungary on April 9, and Turkey on April 21, broke off relations. Bulgaria took no action.

ACTIVITIES OF GOVERNMENT AND PEOPLE. Prompt action followed President Wilson's signing of the resolution. All American ships at foreign stations and the governors and military posts of American insular possessions were notified by wireless of the existence of war. Orders were issued by the navy department for the mobilization of the fleet, and the naval reserve was called to the colors. The navy at once proceeded to seize all radio stations in the country. Congress voted the war fund of \$100,000,000 for the use of the president at his discretion. One of the first acts of the government was to seize every German and Austrian vessel in the harbors of the country and its possessions. There was 91 of these aggregating 630,000 gross tonnage. The largest group was in New York harbor. Here were 27 vessels including the *Vaterland*, *George Washington*, and the *Kaiser Wilhelm II*. The first of these was the largest vessel afloat. The Austrian vessels seized were held subject to payment as the United States was not at war with Austria-Hungary. The immigration authorities took charge of all the German officers and crews who were held to be in the status of intended immigrants whose eligibility for entrance into the country was in question until the end of the war. This decision carried with it internment. It was found upon examination that the machinery of most of the German ships had been damaged to prevent their being used as transports, the result of a concerted movement under the direction of the German government. This dated from the severance of relations on February 3, 1917.

Together with the seizure of these ships came the arrest of Germans suspected of being spies. Several of these had already been convicted of violating American neutrality, and were at liberty under bond pending appeals. Others were under indictment and awaiting trial. The remainder were suspected persons who had long been watched by the Federal authorities. A proclamation was issued by the president warning citizens and aliens against the commission of treason. It was deemed unnecessary to intern all Germans and German reservists and they

were notified that they would not be molested so long as they conducted themselves in accordance with American law.

Congress continued the debate of war measures, and the House, on April 14, passed without a dissenting vote, a bill providing for a loan of \$7,000,000,000. See FINANCIAL REVIEW.

The president, on the following day, issued "a call to service," in which he appealed especially to the agricultural and industrial workers of the country to put forth their utmost efforts to aid in providing and equipping the armies in Europe. He said:

"We must supply abundant food not only for ourselves and for our armies and our seamen, but also for a large part of the nations with whom we have now made common cause, in whose support and by whose sides we shall be fighting.

"We must supply ships by the hundreds out of our shipyards to carry to the other side of the sea, submarines or no submarines, what will every day be needed there, and abundant materials out of our fields and our mines and our factories with which not only to clothe and equip our own forces on land and sea, but also to clothe and equip our people, for whom the gallant fellows under arms can no longer work; to help clothe and equip the armies with which we are cooperating in Europe, and to keep the looms and manufactories there in raw material; coal to keep the fires going in the ships at sea and in the furnaces of hundreds of factories across the sea; steel out of which to make arms and ammunition both here and there; rails for worn out railways back of the fighting fronts; locomotives and rolling stock to take the place of those every day going to pieces; mules, horses, cattle for labor and for military service; everything with which the people of England and France and Italy and Russia have usually supplied themselves, but cannot now afford the men, the materials, or the machinery to make."

The chief war measure of the government introduced in Congress was a bill "to increase temporarily the military establishment of the United States." Its chief feature was the provision for a selective draft (see below). An account of this measure will be found in the article MILITARY PROGRESS and a note of the procedure of its passage in Congress will be found in the article UNITED STATES, *Sixty-Fifth Congress*. Other important measures were the Food Control Bill, which is discussed in the article FOOD CONTROL, and the Espionage Bill, which is treated under the article UNITED STATES, *Sixty-Fifth Congress*.

The entry of the United States into the war was received with great rejoicing by the people of the allied countries. Great Britain and France at once made arrangements to send delegates to a war council at Washington in order to arrange the details of American participation, and to negotiate further loans to the Allies.

An executive order made public on April 13 announced the establishment of defense areas at the entrance to the chief harbors of the Atlantic and Pacific coasts, the Gulf of Mexico, and the insular colonies. One of the reasons for the restrictions in these areas was the presence of German commerce raiders in the western Atlantic.

Mr. Herbert Hoover, head of the American commission for relief in Belgium, was appointed chairman of the newly created Food Board, and at once began his work of conservation of the food resources of the country.

MISSIONS FROM ABROAD. About the middle of April, the expected envoys from France and Great Britain reached the United States. The British mission was headed by Arthur James

Balfour, the British foreign secretary, and included also a number of noted military and naval officers and financiers. On April 22 the mission arrived in Washington to confer with President Wilson. Simultaneously with the arrival of these commissioners to the United States the entry of this country into the war was celebrated in England where, on April 20, for the first time in history, a foreign flag was raised over the Houses of Parliament. Both Houses passed the following resolution: "This House desires to express to the government and people of the United States of America their profound appreciation of the action of their government in joining the Allied powers and thus defending the high cause of freedom and rights of humanity against the gravest menace by which they ever have been faced."

On April 24, the war commissioners from the French republic reached Hampton Roads and at once proceeded to Washington on the president's yacht, the *Mayflower*. The movements of the commission had been kept a profound secret in order to prevent any interference of their progress. As soon as their presence had become known, their journey to Washington became a triumphant procession. It was probably without parallel in the history of the United States since the visit of Lafayette. The commission was headed by René Viviani, former premier, and Marshal Joffre, former commander of the French armies. The latter was the figure that appealed most to the sympathies and affections of the American people, and this was displayed on every occasion in which he appeared. Another noted member of the commission was the Marquis de Chambrun, a descendant of Lafayette, and a leader in the French Chamber of Deputies. The commission on reaching Washington paid its respects to President Wilson, and at once began to take counsel with the British commissioners and with the civil and military heads of the American army and navy.

The Russian revolution which occurred in February created the most sympathetic feeling and interest in the United States. President Wilson at once resolved to send to Russia a war mission, to consult with the authorities of that country and to assist in the establishment of a stable government. Elihu Root, former secretary of state, was appointed chairman of the commission, which included also representatives of the army and navy, financial and transportation systems (see below).

Following the conference in Washington, the French commissioners began an extensive tour in the Eastern and Middle-Western States, including a visit to Chicago, Kansas City, St. Louis, Springfield, Ill., Philadelphia, New York, and Boston. The party left Washington on May 3, and reached Chicago on the following day. The commission was received with enthusiasm especially in Chicago. Prior to setting out on this journey, the British and French commissioners, on April 29, visited Mt. Vernon to pay their respects to George Washington. M. Viviani delivered an eloquent oration on the significance of America's entrance into the great war. Mr. Balfour, as representative of the British mission, also made a notable address. Following their visit to Mt. Vernon, the commissioners met the Senators and Representatives on the floor of Congress. It became known at this

From Committee on Public Information

# ANGLO-FRENCH COMMISSION

Members of the British and French Commissions to the United States visiting Mt. Vernon to pay a tribute to the memory of Washington. In the front row, reading from left to right, Vice Admiral Chocheprat, of the French Navy; Mrs. Eugene Van Rensselaer, Vice Regent for West Virginia of the Mt. Vernon Association; Secretary Daniels; Miss Harriet Clayton Comegys, Regent of the Mt. Vernon Association; Field Marshall Joffre; M. Viviani, head of the French Commissioners; Secretary Lansing; Right Hon. A. J. Balfour, head of the British Commissioners; George Foster, Premier of Canada; Sir Cecil Spring Rice, British Ambassador; and Maj. Gen. G. T. M. Bridges, of the British Commission. Standing back of Secretary Daniels is Sergeant Dryfus, of the French Army, at his left Col. Fabri, and next to him Col. Remond. Next to him, behind M. Viviani, is M. Hovelacque, Inspector General of Public Instruction in France; next to him is the Marquis de Chambrun, a descendant of La Fayette. Next is Maj. Requin and Secretary Franklin K. Lane.

time that Marshal Joffre and other members of the French commission had laid stress upon the necessity of at once sending an army to France. In a statement issued by him, he expressed his belief that American recruits could best be trained behind the battle lines in France.

The French commission, following its journey through the Middle West, arrived, on May 9, in New York City, where elaborate preparation had been made for their reception. They were received by Mayor Mitchel at City Hall, where a great throng of people had gathered to welcome them. The commission spent several days in the city, and wherever its members appeared they were received with the greatest evidence of enthusiasm. Marshal Joffre attended the unveiling in Brooklyn of a memorial tablet to Lafayette. Columbia University conferred upon M. Viviani the degree of Doctor of Laws. This degree was also conferred upon Mr. Balfour in his absence.

While the British and French missions were being honored in New York City, an Italian mission, headed by Prince Ferdinand of Savoy, and including many notable persons, among whom was William Marconi, the famous scientist, arrived in New York City. This mission at once went to Washington where it began conferences with the government authorities. On June 4 the mission began a tour of the South, Middle-West, and East, including the cities of Atlanta, New Orleans, Pittsburgh, and Chicago, arriving in New York City on June 12. They were everywhere received with the same enthusiasm with which the French and British envoys had been greeted.

To the list of Allied countries which had sent missions to the United States, Belgium was now added. The head of the commission was Baron Ludovic Moncheur, who had formerly been the Belgian minister in Washington. Other members were General Leclercq, Hector Carlier, Mr. Osterrich, and Count Louis d'Ursel. On June 18 President Wilson received the commission, and Baron Moncheur delivered to him a letter from King Albert expressing satisfaction at the entry of the United States into the war and appreciation of American aid in relieving distress. Baron Moncheur also delivered an eloquent address in which he expressed the gratitude of his country for the services rendered by the citizens of the United States. To this the president replied in fitting terms. He said:

"The American people have been able to understand and glory in the unflinching heroism of the Belgian people and their Sovereign, and there is not one among us who does not to-day welcome the opportunity of expressing to you our heartfelt sympathy and friendship, and our solemn determination that on the inevitable day of victory, Belgium shall be restored to the place she has so richly won among the self-respecting and respected nations of the earth."

Following the reception of the Belgian commission, came a commission from Russia headed by Boris A. Bakhmetieff. The Russian and Belgian war missions on June 24 visited the tomb of Washington at Mt. Vernon, where Baron Moncheur and Bakhmetieff delivered appropriate and eloquent addresses. The Belgian mission, on June 22, was received by the Senate, and Baron Moncheur addressed that body, and was warmly received.

A mission from Rumania was received by the

secretary of state on July 2. It was headed by the Rev. Basil Lucaciu, president of the Rumanian League, and included a member of the Rumanian army.

A special Japanese mission, headed by Viscount Ishii, Ambassador extraordinary, arrived in the United States in August. The mission included in addition to Viscount Ishii the following: Vice-Admiral Takeshita, Imperial Japanese Navy; Maj. Gen. Sugano, Imperial Japanese Army; Mr. Masanao Hamihara, Consul General at San Francisco; Mr. Matsuzo Nagai, secretary of the foreign office; Commander Ando, Imperial Japanese Navy; Mr. Tadenao Imai, vice consul; Mr. Tashiro Owaku, secretary; Mr. Douglas L. Dunbar, American secretary to the mission.

The mission, on August 14, was welcomed to the United States by Secretary Lansing, and on August 21 Viscount Ishii presented his credentials, as Ambassador, to the president. The commission afterward made a tour of the principal cities of the country. An important result of its visit was the agreement between the United States and Japan, which is noted in the section *Foreign Relations* in the article UNITED STATES.

**THE SELECTIVE DRAFT.** The president, acting under the provisions of the Selective Draft Law, issued on May 18 a stirring proclamation in which he called upon every man in the country between the ages of 21 and 30 to register his readiness for army service. This proclamation fixed June 5 as the day for army registration.

The registration began on June 5, and went on during the following week. The total registration was in the neighborhood of 9,500,000. The census established the total number of males of the country within the registration age to be 10,298,000, but this did not make allowance for about 600,000 men already in the military and naval service, who were not required to register. See MILITARY PROGRESS.

**AMERICAN EXPEDITIONARY FORCE.** On May 18, the president gave orders for the dispatch to France of an expeditionary force of approximately one division of regular troops, under the command of Gen. John J. Pershing (q.v.). Gen. Pershing and staff were directed to precede the troops across. They were to be followed by the forces as soon as preparations could be made.

It was announced about the middle of May that the first American troops to be sent to France would be nine new regiments of American engineers to be recruited from men with railroad experience. The expedition would comprise a total strength of 11,000 or 12,000 men, including every branch of railroad work necessary to build or repair lines.

An announcement was made on June 8, that Gen. Pershing, with fifty-three officers and members of his party, had reached England in safety. On the same day the announcement was made of the safe arrival in France of a corps of one hundred aviators sent to that country for duty in the anti-submarine operations, or for any other activities that might be given them. These were the first officers and men of the regular fighting forces of the United States to arrive in France. The corps was under the command of Lieut. Kenneth Whiting.

On June 13 Gen. Pershing, with his staff,

arrived safely in Paris. He had received in London a most cordial reception. He received also a hearty reception in Boulogne, the port at which he landed, and it was continued in Paris. Gen. Pershing was met by Marshal Joffre, who had been appointed by the French government to assist in the organization and training of the American troops. For a further account of the expeditionary force see *WAR OF THE NATIONS, Military Operations, American Expeditionary Force*.

**THE NEW ARMY.** The gigantic task of providing for the maintenance and training of the new army to be raised under the draft law was at once begun. September 5 was the day for the gathering of the selected men for their assemblage in the different cantonments. On that day, the president issued the following statement:

*"To the Soldiers of the National Army:*

*"You are undertaking a great duty. The heart of the whole country is with you. Everything that you do will be watched with the deepest interest and with the deepest solicitude not only by those who are near and dear to you, but by the whole Nation besides. For this great war draws us all together, makes us all comrades and brothers, as all true Americans felt themselves to be when we first made good our national independence. The eyes of all the world will be upon you, because you are, in some special sense, the soldiers of freedom.*

*"Let it be your pride, therefore, to show all men everywhere not only what good soldiers you are, but also what good men you are, keeping yourselves fit and straight in everything, and pure and clean through and through. Let us set for ourselves a standard so high that it will be a glory to live up to it, and then let us live up to it and add a new laurel to the crown of America. My affectionate confidence goes with you in every battle and every test. God keep and guide you!"*

Sixteen national army camps were constructed in various parts of the United States at points selected by the War Department. The camps were carefully laid out by experienced town planners and engineers to give best results considering all viewpoints.

A typical cantonment city will house 40,000 men. Each barrack building will house 150 men and provide 500 cubic feet of air space per man. Such a cantonment complete contains between 1000 and 1200 buildings and covers about 2000 acres. In addition, each cantonment has a rifle range, drill, parade, and maneuver grounds of about 2000 acres. In many cases all or a large part of the entire site had to be cleared of woods and stumps. The various military units were located on principal or primary roads—a regiment being treated as a primary unit. About 25 miles of roads were constructed at each cantonment, and sewers, water supply, lighting facilities, and other improvements installed.

An infantry regiment requires 22 barrack buildings, 6 for officers' quarters, 2 storehouses, 1 infirmary building, 28 lavatories, with hot and cold shower baths, or a total of 59 buildings. In addition to the buildings necessary for the regimental units, each cantonment has buildings for divisional headquarters, quartermaster depots, laundry receiving and distributing stations, base hospitals having 1000 beds, post exchanges, and other buildings for general use.

At several of the cantonments remount stations were provided, some of them having a capacity to maintain 12,000 horses.

Following are the names and locations of the national army camps:

Site	Camp
American Lake, Wash. ....	Camp Lewis
Annapolis Junction, Md. ....	Camp Meade
Atlanta, Ga. ....	Camp Gordon
Ayer, Mass. ....	Camp Devens
Battle Creek, Mich. ....	Camp Custer
Chillicothe, Ohio ....	Camp Sherman
Columbia, S. C. ....	Camp Jackson
Des Moines, Iowa ....	Camp Dodge
Fort Riley, Kans. ....	Camp Funston
Fort Sam Houston, Tex. ....	Camp Travis
Little Rock, Ark. ....	Camp Pike
Louisville, Ky. ....	Camp Taylor
Petersburg, Va. ....	Camp Lee
Rockford, Ill. ....	Camp Grant
Wrightstown, N. J. ....	Camp Dix
Yaphank, L. I. ....	Camp Upton

Sixteen divisional camps were established for the mobilization and training of the national guard as follows:

Site	Camp
Charlotte, N. C. ....	Camp Greene
Spartanburg, S. C. ....	Camp Wadsworth
Augusta, Ga. ....	Camp Hancock
Anniston, Ala. ....	Camp McClellan
Greenville, S. C. ....	Camp Sevier
Macon, Ga. ....	Camp Wheeler
Waco, Tex. ....	Camp MacArthur
Houston, Tex. ....	Camp Logan
Deming, N. M. ....	Camp Cody
Fort Sill, Okla. ....	Camp Doniphan
Fort Worth, Tex. ....	Camp Bowie
Montgomery, Ala. ....	Camp Sheridan
Hattiesburg, Miss. ....	Camp Shelby
Alexandria, La. ....	Camp Beauregard
Buena Vista, Cal. ....	Camp Kearny
Palo Alto, Cal. ....	Camp Fremont

**VOLUNTEER DIVISION.** At the time of signing the Selective Draft Law, the president issued a statement, which was chiefly of interest as related to the voluntary division which Theodore Roosevelt proposed to raise. The conference committees of the two Houses had agreed to accept such a division. In regard to this, the president said:

"I shall not avail myself, at any rate at the present stage of the war, of the authorization conferred by the act to organize volunteer divisions. To do so would seriously interfere with the carrying out of the chief and most immediately important purpose contemplated by this legislation: the prompt creation and early use of an effective army, and would contribute practically nothing to the effective strength of the armies now engaged against Germany. I understand that the section of this act which authorizes the creation of volunteer divisions in addition to the draft was added with a view to providing an independent command for Mr. Roosevelt and giving the military authorities an opportunity to use his fine vigor and enthusiasm in recruiting the forces now at the Western Front. It would be very agreeable to me to pay Mr. Roosevelt this compliment and the Allies the compliment of sending to their aid one of our most distinguished public men, an ex-president, who has rendered many conspicuous public services and proved his gallantry in many striking ways. Politically, too, it would no doubt have a very fine effect and make a profound impression. But this is not the time or the occasion for compliment or for any action not calculated to contribute to the immediate success of the war. The business now in hand is undramatic and calls for practical scientific definiteness and precision. I shall act with regard to it at every step and in every particular under expert and professional advice, from both sides of the water.

"That advice is that the men most needed are men of the ages contemplated in the draft provisions of the present bill, not men of the age and sort contemplated on the section which authorizes the formation of volunteer units, and that for the

preliminary training of the men who are to be drafted we shall need all of our experienced officers. Mr. Roosevelt told me, when I had the pleasure of seeing him a few weeks ago, that he would wish to have associated with him some of the most effective officers of the Regular Army. He named many of those whom he would desire to have designated for the service, and they were men who can not possibly be spared from the too small force of officers at our command for the much more pressing and necessary duty of training regular troops to be put into the field in France and Belgium as fast as they can be got ready. The first troops sent to France will be taken from the present forces of the Regular Army and will be under the command of trained soldiers only.

"The responsibility for the successful conduct of our own part in this great war rests upon me. I could not escape it if I would. I am too much interested in the cause we are fighting for to be interested in anything but success. The issues involved are too immense for me to take into consideration anything whatever except the best, most effective, most immediate means of military action. What these means are, I know from the mouths of men who have seen war as it is now conducted, who have no illusions, and to whom the whole grim matter is a matter of business. I shall centre my attention upon those means and let everything else wait. I should be deeply to blame should I do otherwise, whatever the argument of policy or of personal gratification or advantage."

As the result of this action on the part of the president, Mr. Roosevelt at once abandoned his efforts to raise the proposed division.

**THE NAVY.** The first shot from an American gun in the war was fired on April 19, the anniversary of the battle of Lexington. The gun was mounted on the American steamer *Mongolia* plying between the United States and England. A periscope of a submarine was sighted ahead of the vessel, and Lieut. Bruce R. Ware, who was in command of the gunners' crew, at once gave the command to fire. The submarine disappeared but rose again, this time aside of the *Mongolia*. Another shot was fired which shattered the periscope and apparently destroyed the submarine, which did not again appear.

Navy preparations rapidly went forward and Maj. Gen. George W. Goethals, head of the United States Shipping Board Emergency Fleet Corporation, made contracts for the building of the first ten ships of the wooden merchant fleet. It was announced that one thousand of these ships would ultimately be constructed. For a detailed discussion of the navy in connection with shipbuilding, see **SHIPBUILDING**.

It became known about the middle of May that a squadron of American destroyers under Rear Admiral Sims (q.v.) had arrived at Queenstown on May 4, and had at once begun operation against the German U-boats. The American ships were received with great enthusiasm at the British port. After the commander of the British fleet had greeted the American commander he asked "When can you be ready for business?" and the American commander replied: "We can start at once."

On June 7, the Navy Department made public the details of an encounter between the American ship *Silver Shell* and a German submarine, which occurred on May 30. The steamer was armed and the guns were manned by an American navy crew. The submarine was first seen at a distance of 7000 yards. On its approach to the ship, the guns of the vessel were fired and the submarine responded. A fight ensued which continued for an hour and a half, during which the submarine fired 35 shots and the steamer 25. The last shot of the steamer ap-

parently struck the submarine, which rose high above the water and then disappeared. No damage was suffered by the steamer.

See section below on *Naval Engagements*.

**LIBERTY LOAN.** Early in May, Secretary McAdoo, of the Treasury, announced that arrangements had been made for popular subscription to the first war loan of \$2,000,000,000. The loan was entirely successful and greatly oversubscribed. Concerning this and subsequent issues see **FINANCIAL REVIEW**. It was also announced that the first installment of loans to France, Italy, and Russia would be made during May, and that loans to Belgium, Serbia, and other Allied countries were also under consideration.

**MISSION TO RUSSIA.** We have already noted the fact that the president had appointed former Senator Root as the head of the commission to Russia. The United States government had been the first to recognize the new government of Russia (March '27). The news was received on June 4, that the American mission had safely landed in Russia. Its members in addition to Mr. Root included John R. Mott, Cyrus McCormick, Samuel R. Barton, James Duncan, and Charles Edward Russell, with Maj. Gen. Hugh L. Scott and Rear Admiral James H. Glennon, representing respectively the army and navy. The commission was also accompanied by a number of aides and clerks. They were joined in Russia by Charles R. Crane, Maj. Stanley Washburn, and others. The commission proceeded at once to Petrograd, where, on June 15, Mr. Root delivered to the head of the provincial government the following communication from President Wilson:

In view of the approaching visit of the American delegation to Russia to express the deep friendship of the American people for the people of Russia and to discuss the best and most practical means of coöperation between the two peoples in carrying the present struggle for the freedom of all peoples to a successful consummation, it seems opportune and appropriate that I should state again, in the light of this new partnership, the objects the United States has had in mind in entering the war. Those objects have been very much beclouded during the past few weeks by mistaken and misleading statements, and the issues at stake are too momentous, too tremendous, too significant for the whole human race to permit any misinterpretations or misunderstandings, however slight, to remain uncorrected for a moment.

The war has begun to go against Germany, and in their desperate desire to escape the inevitable ultimate defeat those who are in authority in Germany are using every possible instrumentality, are making use even of the influence of groups and parties among their own subjects to whom they have never been just or fair or even tolerant, to promote a propaganda on both sides of the sea which will preserve for them their influence at home and their power abroad, to the undoing of the very men they are using.

The position of America in this war is so clearly avowed that no man can be excused for mistaking it. She seeks no material profit or aggrandizement of any kind. She is fighting for no advantage or selfish object of her own, but for the liberation of peoples everywhere from the aggressions of autocratic force. The ruling classes in Germany have begun of late to profess a like liberality and justice of purpose, but only to preserve the power they have set up to Germany and the selfish advantages which they have wrongly gained for themselves and their private projects of power all the way from Berlin to Bagdad and beyond. Government after government has by their influence, without open conquest of its territory, been linked together in a net of intrigue directed against nothing less than the peace and liberty of the world. The meshes of that intrigue must be broken, but cannot be broken unless wrongs already done are undone; and adequate measures must be taken to

prevent it from ever again being rewoven or repaired.

Of course, the Imperial German government and those whom it is using for their own undoing are seeking to obtain pledges that the war will end in the restoration of the *status quo ante*. It was the *status quo ante* out of which this iniquitous war issued forth, the power of the Imperial German government within the empire and its widespread domination and influence outside of that empire. That status must be altered in such fashion as to prevent any such hideous thing from ever happening again.

We are fighting for the liberty, the self-government, and the undictated development of all peoples, and every feature of the settlement that concludes this war must be conceived and executed for that purpose. Wrongs must first be righted, and then adequate safeguards must be created to prevent their being committed again. We ought not to consider remedies merely because they have a pleasing and sonorous sound. Practical questions can be settled only by practical means. Phrases will not accomplish the result. Effective readjustments will; and whatever readjustments are necessary must be made.

But they must follow a principle, and that principle is plain. No people must be forced under sovereignty under which it does not wish to live. No territory must change hands except for the purpose of securing those who inhabit it a fair chance of life and liberty. No indemnities must be insisted on except those that constitute payment for manifest wrongs done. No readjustments of power must be made except such as will tend to secure the future peace of the world and the future welfare and happiness of its peoples.

And then the free peoples of the world must draw together in some common covenant, some genuine and practical coöperation that will in effect combine their force to secure peace and justice in the dealings of nations with one another. The brotherhood of mankind must no longer be a fair but empty phrase; it must be given a structure of force and reality. The nations must realize their common life and effect a workable partnership to secure that life against the aggressions of autocratic and self-pleasing power.

For these things we can afford to pour out blood and treasure. For these are the things we have always professed to desire, and unless we pour out blood and treasure now and succeed, we may never be able to unite or show conquering force again in the great cause of human liberty. The day has come to conquer or submit. If the forces of autocracy can divide us they will overcome us: if we stand together, victory is certain and the liberty which victory will secure. We can afford then to be generous, but we cannot afford then or now to be weak or omit any single guarantee of justice and security.

At the same time upon the introduction of the American commission to the Council of Ministers, Mr. Root delivered an address, of which the main points were as follows:

"The news of Russia's new-found freedom brought to America universal satisfaction and joy. From all the land sympathy and hope went out toward the new sister in the circle of democracies, and this mission is sent to express that feeling. The American democracy sends to the democracy of Russia greeting, sympathy, friendship, brotherhood, and Godspeed.

"One fearful danger threatens both nations—the armed forces of military autocracy are at the gates of Russia and her Allies. The triumph of German arms will mean the death of liberty in Russia. No enemy is at the gates of America, but America has come to realize that the triumph of German arms means the death of liberty in the world; that we who love liberty and would keep it must fight for it and fight now when the free democracies of the world may be strong in union and not delay until they may be beaten down separately in succession. So America sends another message to Russia: that we are going to fight and have already begun to fight for your freedom equally with our own and we ask you to fight for our freedom equally with yours. We would make your cause ours and with common purpose and the mutual helpfulness of firm alliance make sure the victory over our common foe."

He then quoted from the president's address on April 2 (see above) the passages relating

to the disinterested purpose of the United States in entering the war and its sympathy with the democratic movement in Russia, and declared in conclusion that in the great struggle for human freedom the oldest of the great democracies now sought fraternal union with the youngest.

**FLAG DAY ADDRESS.** On Flag Day, June 14, the president delivered a notable address which was devoted almost entirely to a discussion of the conditions under which we were at war with Germany. This address, although not an official one, was considered by statesmen in the United States and in the Allied countries, as one of the most satisfactory statements yet issued of the reasons for the warfare against the German Empire. The address was as follows:

**MY FELLOW CITIZENS:** We meet to celebrate Flag Day because this flag which we honor, and under which we serve, is the emblem of our unity, our power, our thought, and purpose as a nation. It has no other character than that which we give it from generation to generation. The choices are ours. It floats in majestic silence above the hosts that execute those choices, whether in peace or in war. And yet, though silent, it speaks to us—speaks to us of the past, of the men and women who went before us and of the records they wrote upon it. We celebrate the day of its birth, and from its birth until now it has witnessed a great history, has floated on high the symbol of great events, of a great plan of life worked out by a great people. We are about to carry it into battle, to lift it where it will draw the fire of our enemies. We are about to bid thousands, hundreds of thousands, it may be millions, of our men, the young, the strong, the capable men of the nation, to go forth and dibeneath it on fields of blood far away—for what? For some unaccustomed thing? For something for which it has never sought before? American armies were never before sent across the seas. Why are they sent now? For some new purpose for which this great flag has never been carried before or for some old, familiar, heroic purpose for which it has seen men, its own men, die on every battlefield upon which Americans have borne arms since the Revolution?

These are questions which must be answered. We are Americans. We in our turn serve America, and can serve her with no private purpose. We must use her flag as she has always used it. We are accountable at the bar of history and must plead in utter frankness what purpose it is we seek to serve.

It is plain enough how we were forced into the war. The extraordinary insults and aggressions of the Imperial German government left us no self-respecting choice but to take up arms in defense of our rights as a free people and of our honor as a sovereign government. The military masters of Germany denied us the right to be neutral. They filled our unsuspecting communities with vicious spies and conspirators and sought to corrupt the opinion of our people in their own behalf.

When they found that they could not do that their agents diligently spread sedition among us and sought to draw our own citizens from their allegiance—and some of these agents were men connected with the official embassy of the German government itself here in our own capital. They sought by violence to destroy our industries and arrest our commerce. They tried to incite Mexico to take up arms against us and to draw Japan into a hostile alliance with her—and that, not by indirection but by direct suggestion from the Foreign Office in Berlin. They impudently denied us the use of the high seas and repeatedly executed their threat that they would send to their death any of our people who ventured to approach the coasts of Europe. And many of our own people were corrupted. Men began to look upon their own neighbors with suspicion and to wonder in their hot resentment and surprise whether there was any community in which hostile intrigue did not lurk. What great nation in such circumstances would not have taken up arms? Much as we had desired peace it was denied us, and not of our own choice. This flag under which we serve would have been dishonored had we withheld our hand.

But that is only part of the story. We know now as clearly as we knew before we were our-

selves engaged that we are not the enemies of the German people and that they are not our enemies. They did not originate or desire this hideous war or wish that we should be drawn into it; and we are vaguely conscious that we are fighting their cause, as they will some day see it, as well as our own. They are themselves in the grip of the same sinister power that has now at last stretched its ugly talons out and drawn blood from us. The whole world is at war because the whole world is in the grip of that power and is trying out the great battle which shall determine whether it is to be brought under its mastery or fling itself free.

The war was begun by the military masters of Germany, who proved to be also the masters of Austria-Hungary. These men have never regarded nations as peoples, men, women, and children of like blood and frame as themselves, for whom governments existed and in whom governments had their life. They have regarded them merely as serviceable organizations which they could by force or intrigue bend or corrupt to their own purpose. They have regarded the smaller states in particular and the peoples who could be overwhelmed by force as their natural tools and instruments of domination. Their purpose has long been avowed. The statesmen of other nations, to whom that purpose was incredible, paid little attention; regarded what German professors expounded in their class rooms and German writers set forth to the world as the goal of German policy as rather the dream of minds detached from practical affairs, as preposterous private conceptions of German destiny than as the actual plans of responsible rulers; but the rulers of Germany themselves knew all the while what concrete plans, what well advanced intrigues lay back of what the professors and the writers were saying, and were glad to go forward unmoled, filling the thrones of Balkan states with German princes, putting German officers at the service of Turkey to drill her armies and make interest with her government, developing plans of sedition and rebellion in India and Egypt, setting their fires in Persia. The demands made by Austria upon Serbia were a mere single step in a plan which compassed Europe and Asia, from Berlin to Bagdad. They hoped those demands might not arouse Europe, but they meant to press them whether they did or not, for they thought themselves ready for the final issue of arms.

Their plan was to throw a broad belt of German military power and political control across the very centre of Europe and beyond the Mediterranean into the heart of Asia, and Austria-Hungary was to be as much their tool and pawn as Serbia or Bulgaria or Turkey or the ponderous states of the East. Austria-Hungary, indeed, was to become part of the Central German Empire, absorbed and dominated by the same forces and influences that had originally cemented the German states themselves. The dream had its heart at Berlin. It could have had a heart nowhere else. It rejected the idea of solidarity of race entirely. The choice of peoples played no part in it at all. It contemplated binding together racial and political units which could be kept together only by force—Czechs, Magyars, Croats, Serbs, Rumanians, Turks, Armenians—the proud states of Bohemia and Hungary, the stout little commonwealths of the Balkans, the indomitable Turks, the subtle peoples of the East. These peoples did not wish to be united. They ardently desired to direct their own affairs, and would be satisfied only by undisputed independence. They could be kept quiet only by the presence or the constant threat of armed men. They would live under a common power only by sheer compulsion and await the day of revolution. But the German military statesmen had reckoned with all that and were ready to deal with it in their own way.

And they have actually carried the greater part of that amazing plan into execution. Look how things stand. Austria is at their mercy. It has acted, not upon its own initiative or upon the choice of its own people but at Berlin's dictation ever since the war began. Its people now desire peace, but cannot have it until leave is granted from Berlin. The so-called Central Powers are in fact but a single power. Serbia is at its mercy, should its hands be but for a moment freed. Bulgaria has consented to its will, and Rumania is overrun. The Turkish armies, which Germans trained, are serving Germany, certainly not themselves, and the guns of German warships lying in the harbor at Constantinople remind Turkish statesmen every day that they have no choice but to follow their orders from Berlin. From Hamburg to the Persian Gulf the net is spread.

Is it not easy to understand the eagerness for

peace that has been manifested from Berlin ever since the snare was set and sprung? Peace, peace, peace has been the talk of her Foreign Office for now a year and more; not peace upon her own initiative but upon the initiative of the nations over which she now deems herself to hold the advantage. A little of the talk has been public, but most of it has been private. Through all sorts of channels it has come to me, and in all sorts of guises, but never with the terms disclosed which the German government would be willing to accept. That government has other valuable pawns in its hands besides those I have mentioned. It still holds a valuable part of France, though with slowly relaxing grasp, and practically the whole of Belgium. Its armies press close upon Russia and overrun Poland at their will. It cannot go further; it dare not go back. It wishes to close its bargain before it is too late and it has little left to offer for the pound of flesh it will demand.

The military masters under whom Germany is bleeding see very clearly to what point fate has brought them. If they fall back or are forced back an inch, their power both abroad and at home will fall to pieces like a house of cards. It is their power at home they are thinking about now more than their power abroad. It is that power which is trembling under their very feet, and deep fear has entered their hearts. They have but one chance to perpetuate their military power or even their controlling political influence. If they can secure peace now with the immense advantages still in their hands which they have up to this point apparently gained, they will have justified themselves before the German people; they will have gained by force what they promised to gain by it, an immense expansion of German power, an immense enlargement of German industrial and commercial opportunities. Their prestige will be secure, and with their prestige their political power. If they fall, their people will thrust them aside; a government accountable to the people themselves will be set up in Germany as it has been in England, in the United States, in France, and in all the great countries of the modern time except Germany. If they succeed they are safe and Germany and the world are undone; if they fail Germany is saved and the world will be at peace. If they succeed America will fall within the menace. We and all the rest of the world must remain armed as they will remain, and must make ready for the next step in their aggression; if they fail the world may unite for peace and Germany may be of the union.

Do you not now understand the new intrigue, the intrigue for peace, and why the masters of Germany do not hesitate to use any agency that promises to effect their purpose, the deceit of the nations? Their present particular aim is to deceive all those who throughout the world stand for the rights of peoples and the self-government of nations; for they see what immense strength the forces of justice and of liberalism are gathering out of this war. They are employing liberals in their enterprise. They are using men, in Germany and without, as their spokesmen whom they have hitherto despised and oppressed, using them for their own destruction—Socialists, the leaders of labor, the thinkers they have hitherto sought to silence. Let them once succeed and these men, now their tools, will be ground to powder beneath the weight of the great military empire they will have set up; the revolutionists in Russia will be cut off from all succor or cooperation in western Europe and a counter-revolution fostered and supported; Germany herself will lose her chance of freedom, and all Europe will arm for the next, the final, struggle.

The sinister intrigue is being no less actively conducted in this country than in Russia and in every country in Europe to which the agents and dupes of the Imperial German government can get access. That government has many spokesmen here, in places high and low. They have learned discretion. They keep within the law. It is opinion they utter now not sedition. They proclaim the liberal purposes of their masters, declare this a foreign war which can touch America with no danger to either her lands or her institutions, set England at the centre of the stage and talk of her ambition to assert economic dominion throughout the world, appeal to our ancient tradition of isolation in the politics of the nations, and seek to undermine the government with false professions of loyalty to its principles.

But they will make no headway. The false betray themselves always in every accent. It is only friends and partisans of the German government whom we have already identified who utter these thinly disguised disloyalties. The facts are

patent to all the world, and nowhere are they more plainly seen than in the United States, where we are accustomed to deal with facts and not with sophistries, and the great fact that stands out above all the rest is that this is a people's war, a war for freedom and justice and self-government among all the nations of the world, a war to make the world safe for the peoples who live upon it and have made it their own, the German people themselves included, and that with us rests the choice to break through all these hypocrisies and patent cheats and masks of brute force and help set the world free or else stand aside and let it be dominated a long age through by sheer weight of arms and the arbitrary choices of self-constituted masters, by the nations which can maintain the biggest armies and the most irresistible armaments—a power to which the world has afforded no parallel, and in the face of which political freedom must wither and perish.

For us there is but one choice. We have made it. Woe be to the man or group of men that seeks to stand in our way in this day of high resolution when every principle we hold dearest is to be vindicated and made secure for the salvation of the nations. We are ready to plead at the bar of history, and our flag shall wear a new lustre. Once more we shall make good with our lives and fortunes the great faith to which we were born, and a new glory shall shine in the face of our people.

**THE POPE AND PEACE.** From the outset of the war, Pope Benedict had been assiduous in his efforts to establish a permanent peace between the belligerents. These efforts he had carried on with absolute neutrality of purpose and performance. He had gone with great cautiousness about this diplomatic task, and the only encouragement he received was from the Central Powers. On August 1, 1917, the Pope communicated to the various belligerents, a note, inviting these governments to agree on certain points which seemed to him "to offer the basis of a just and lasting peace." This message is discussed in some detail in the article *WAR OR THE NATIONS, The Diplomacy of the War*. In reply to it President Wilson, as spokesman for the United States and her Allies, sent to the Pope, on August 22, the following note:

Every heart that has not been blinded and hardened by this terrible war must be touched by this moving appeal of His Holiness the Pope, must feel the dignity and force of the humane and generous motives which prompted it, and must fervently wish that we might take the path of peace he so persuasively points out. But it would be folly to take it if it does not in fact lead to the goal he proposes. Our response must be based upon the stern facts and upon nothing else. It is not a mere cessation of arms he desires; it is a stable and enduring peace. This agony must not be gone through with again, and it must be a matter of very sober judgment what will insure us against it.

His Holiness in substance proposes that we return to the *status quo ante bellum*, and that then there be a general condonation, disarmament, and a concert of nations based upon an acceptance of the principle of arbitration; that by a similar concert freedom of the seas be established; and that the territorial claims of France and Italy, the perplexing problems of the Balkan states, and the restitution of Poland be left to such conciliatory adjustments as may be possible in the new temper of such a peace, due regard being paid to the aspirations of the peoples whose political fortunes and affiliations will be involved.

It is manifest that no part of this programme can be successfully carried out unless the restitution of the *status quo ante* furnishes a firm and satisfactory basis for it. The object of this war is to deliver the free peoples of the world from the menace and the actual power of a vast military establishment controlled by an irresponsible government which, having secretly planned to dominate the world, proceeded to carry the plan out without regard either to the sacred obligations of treaty or the long-established practices and long-cherished principles of international action and honor; which chose its own time for the war: delivered its blow fiercely and suddenly; stopped at no barrier either of law or of mercy; swept a whole continent within the tide of blood—not the blood of soldiers

only, but the blood of innocent women and children also and of the helpless poor; and now stands balked but not defeated, the enemy of four-fifths of the world. This power is not the German people. It is the ruthless master of the German people. It is no business of ours how that great people came under its control or submitted with temporary zest to the domination of its purpose; but it is our business to see to it that the history of the rest of the world is no longer left to its handling.

To deal with such a power by way of peace upon the plan proposed by His Holiness the Pope would, so far as we can see, involve a recuperation of its strength and a renewal of its policy; would make it necessary to create a permanent hostile combination of nations against the German people, who are its instruments; and would result in abandoning the new-born Russia to the intrigue, the manifold subtle interference, and the certain counter-revolution which would be attempted by all the malign influences to which the German government has of late accustomed the world. Can peace be based upon a restitution of its power or upon any word of honor it could pledge in a treaty of settlement and accommodation?

Responsible statesmen must now everywhere see, if they never saw before, that no peace can rest securely upon political or economic restrictions meant to benefit some nations and cripple or embarrass others, upon vindictive action of any sort, or any kind of revenge or deliberate injury. The American people have suffered intolerable wrongs at the hands of the Imperial German government, but they desire no reprisal upon the German people, who have themselves suffered all things in this war, which they did not choose. They believe that peace should rest upon the rights of peoples, not the rights of governments—the rights of peoples great or small, weak or powerful—their equal right to freedom and security and self-government and to a participation upon fair terms in the economic opportunities of the world, the German people of course included if they will accept equality and not seek domination.

The test, therefore, of every plan of peace is this: Is it based upon the faith of all the peoples involved or merely upon the word of an ambitious and intriguing government, on the one hand, and of a group of free peoples, on the other? This is a test which goes to the root of the matter; and it is the test which must be applied.

The purposes of the United States in this war are known to the whole world, to every people to whom the truth has been permitted to come. They do not need to be stated again. We seek no material advantage of any kind. We believe that the intolerable wrongs done in this war by the furious and brutal power of the Imperial German government ought to be repaired, but not at the expense of the sovereignty of any people—rather a vindication of the sovereignty both of those that are weak and of those that are strong. Punitive damages, the dismemberment of empires, the establishment of selfish and exclusive economic leagues, we deem inexpedient and in the end worse than futile, no proper basis for a peace of any kind, least of all for an enduring peace. That must be based upon justice and fairness and the common rights of mankind.

We can not take the word of the present rulers of Germany as a guarantee of anything that is to endure, unless explicitly supported by such conclusive evidence of the will and purpose of the German people themselves as the other peoples of the world would be justified in accepting. Without such guarantees treaties of settlement, agreements for disarmament, covenants to set up arbitration in the place of force, territorial adjustments, reconstitutions of small nations, if made with the German government, no man, no nation could now depend on. We must await some new evidence of the purposes of the great peoples of the Central Powers. God grant it may be given soon and in a way to restore the confidence of all peoples everywhere in the faith of nations and the possibility of a covenanted peace.

**GERMAN INTRIGUES AND PROPAGANDA.** Extraordinary revelations during the year of the activities of the German Foreign Office, both before and after the entry of the United States into the war aroused much indignation. These revelations included the work of propaganda in the United States and in Mexico, and in several of the South American countries.

A matter of the greatest interest and importance was the publication on August 14, 1917, of the personal message of the German emperor to President Wilson, sent on August 14, 1914, which formed a defense of Germany's entrance into the war. This message, which was sent in August, 1914, by Ambassador Gerard to President Wilson, had not at the time been made public in its complete form, which was as follows:

*"Private and confidential.*

*"For the President personally.*

"One. The Royal Highness Prince Henry was received by His Majesty King George V in London, who empowered him to transmit to me verbally that England would remain neutral if war broke out on the continent involving Germany and France, Austria and Russia. This message was telegraphed to me by my brother from London after his conversation with His Majesty the King and repeated verbally on the 29th July.

"Two. My ambassador in London transmitted a message from Sir Edward Grey to Berlin saying that only in case France was likely to be crushed England would interfere.

"Three. On the 30th my ambassador in London reported that Sir Edward Grey in the course of a private (sic) conversation, told him that if the conflict remained localized between Russia—not Serbia—and Austria, England would not move, but if we mixed in the fray she would take quick decisions and grave manœuvres; in other words, if I left my ally, Austria, in the lurch to fight alone England would not touch me.

"Four. This communication being directly counter to the King's message to me, I telegraphed to His Majesty on the 29th or 30th thanking him for kind message through my brother and begging him to use all his power to keep France and Russia, his allies, from making any warlike preparations calculated to disturb my work on mediation, stating that I was in constant communication with His Majesty the Czar. In the evening the King kindly answered that he had ordered his government to use every possible influence with his allies to repudiate taking any provocative military measures. At the same time His Majesty asked me I should transmit to Vienna the British proposal that Austria was to take Belgrade and a few other Serbian towns and a strip of country as a main mise (sic) to make sure that the Serbian promises on paper should be fulfilled in reality. This proposal was in the same moment telegraphed to me from Vienna for London quite in conjunction with the British proposal; besides I had telegraphed to His Majesty the Czar the same as an idea of mine before I received the two communications from Vienna and London. As both were of the same opinion, I immediately transmitted the telegrams vice versa to Vienna and London. I felt that I was able to tide the question over and was happy at the peaceful outlook.

"Five. While I was preparing a note to His Majesty the Czar the next morning to inform him that Vienna, London, and Berlin were agreed about the treatment of affairs, I received the telephone message from his excellency the chancellor that in the night before, the Czar had given the order to mobilize the whole of the Russian Army, which was of course also meant against Germany; whereas up till then the southern armies had been mobilized against Austria.

"Six. In a telegram from London my ambassador informed me he understood British government would guarantee neutrality of France and wished to know whether Germany would refrain from attack. I telegraphed to His Majesty the King personally that mobilization being already carried out could not be stopped, but if His Majesty could guarantee with his armed forces the neutrality of France I would refrain from attacking her, leave her alone, and employ my forces elsewhere. His Majesty answered that he thought my offer was based on a misunderstanding, and as far as I can make out Sir Edward Grey never took my offer into serious consideration. He never answered it. Instead he declared England had to defend Belgian neutrality, which had to be violated by Germany on strategical grounds, news having been received that France was already preparing to enter Belgium and the King of the Belgians having refused my petition for a free passage under guarantee of his country's freedom. I am most grateful for the President's message. Wilhelm."

The Committee on Public Information made public on September 27 revelations in regard to German propaganda in the United States, derived from newspapers seized in 1916 from a prominent agent, Wolf von Igel. This man established an office in New York in the autumn of 1914, where he carried on propaganda work in its most varied forms. In April, 1916, while von Igel was preparing papers to be transmitted to the German embassy at Washington, his office was entered by four secret service agents, who put him under arrest, and took charge of his papers. Ambassador Count von Bernstorff protested against this seizure, declaring the papers seized were official, and were exempt from such seizure. When the papers were examined, they were found to contain evidence which made it clear that German agents were violating the laws of the United States, planning for the destruction of lives and property and merchant vessels on the high seas, forming far-reaching plots against Great Britain and Ireland, the United States and Mexico; and endeavoring to corrupt American writers and lecturers. A special system was maintained under the guise of an American Information Bureau, for the purpose of stirring up labor troubles in ammunition plants and was engaged in the preparation of bombs for the destruction of American munition factories and ships. The papers included letters to von Bernstorff commending John Devoy, a prominent Irish-American, as a valuable man for carrying on German propaganda. Reports in regard to Devoy's activities were also included. A letter relating to Judge Cohalan of New York was said to show that he had offered advice in regard to stirring up revolutions in Ireland. Both Devoy and Judge Cohalan denied any guilty connections with the German government. Evidence was found to indicate that several American citizens, who were well known as journalists and lecturers, had received payment from German authorities for propaganda work. These included Edwin Emerson and F. J. Archibald, who was arrested in 1916 while carrying important papers to Germany from the United States. The documents revealed through this seizure were of the greatest value in searching for evidence of German activities, and in bringing about the arrest of many suspected persons.

The State Department, through its secret service, discovered, during the year, that messages had been regularly sent between Argentina and Germany, through the medium of the Swedish minister to Argentina, and that the German minister in Mexico had, in March, 1916, strongly commended the work in behalf of Germany done by Folke Cronholm, the Swedish Chargé-d'Affaires in Mexico. He recommended a decoration in recognition of his services.

Much more sensational, however, was the declaration made public of the correspondence carried on by Count Luxburg, the German Chargé-d'Affaires at Buenos Aires, with the Foreign Office at Berlin through the Swedish legation as a medium of communication. The first of these messages made public was dated May 19, 1917. After detailing the release of certain German and Austrian ships by the Argentine government, and speaking of the change in public feeling in Argentina in behalf of the Germans, he said:

"This government will, in the future, only clear Argentine ships as far as Las Palmas. I beg that the small steamers *Oran* and *Guazo*, thirty-first January (meaning, which sailed 31) which are now nearing Bordeaux with a view to change of flag, may be spared if possible, or else sunk without a trace being left ('spurious versenkt'). Another message followed on July 3:

"I learn from a reliable source that the Acting Minister of Foreign Affairs, who is a notorious ass and anglophile, declared in a secret session of the senate, that Argentina would demand from Berlin a promise not to sink more Argentine ships. If not agreed to, relations would be broken off. I recommend refusal, and if necessary, calling in the mediation of Spain."

Other messages in the same form followed, showing that a constant communication had been carried on between Argentina and Germany through one source. The Swedish government denied any wrong intentions or acts, but a satisfactory adjustment had not been made at the end of the year. On September 21, the secretary of state made public the following message from von Bernstorff to the Berlin Foreign Office, dated January 22, 1917:

"I request authority to pay out up to \$50,000 in order, as on former occasions, to influence Congress through the organization you know of, which can perhaps prevent war. I am beginning in the meantime to act accordingly.

"In the above circumstances a public official German declaration in favor of Ireland is highly desirable, in order to gain the support of Irish influence here."

The publication of this message created a profound sensation in Congress. A resolution was at once adopted to investigate as to any possible criminal plans in German activities as indicated by this note. No definite action, however, was taken.

On September 22, 1917, the secretary of state published the following:

"In view of inquiries which have been made as to whether Count Bernstorff knew of the purpose of his government to renew relentless submarine warfare when he sent his message of January 22, 1917, asking authorization to expend \$50,000. I can state that the Department of State possesses conclusive evidence that on or before January 19, Count Bernstorff had received and read the Zimmermann telegram to Minister von Eckhart in Mexico which contained the following:

"We intend to begin on the 1st of February unrestricted submarine warfare. We shall endeavor in spite of this to keep the United States of America neutral."

"Count Bernstorff was, therefore, fully advised of the intentions of the Imperial government at the time when he asked for authority of Berlin to employ funds for an organization to influence Congressional action in favor of the continued neutrality of this country."

On December 21, 1917, Secretary Lansing made public another series of telegrams exchanged between Count Luxburg and the German government through the Swedish Minister. These made it plain that the German government was keeping in close touch through this channel with happenings in South American countries. It indicated also the strong desire of the German government to preserve the neutrality of this country.

One of the most daring attempts at propaganda work was carried on by a Levantine adventurer, Bolo Pasha, who came to the United States with the purpose of influencing or purchasing newspapers in behalf of German propaganda. He was supplied with a large amount of money by the German government, and large sums were deposited with a banking house of German affiliations in New York City. On his

arrival in this country, Bolo entered into negotiations with Adolph Pavenstedt, then a member of the banking house Amsinck and Co. Pavenstedt carried Bolo's plans to Ambassador Bernstorff, and as a result, the German Ambassador directed Hugo Schmidt, the German financial agent in America, to pay to Bolo \$1,750,000.

Bolo secured introductions to prominent men, including William Randolph Hearst, whom he convinced that he was a friend of France and was carrying on work in behalf of that country. It was afterward revealed that he was in close relations with Senator Humbert of France, who received large sums of money from the German funds supplied to Bolo. The intrigues of Bolo Pasha were revealed through an investigation carried on by Merton Lewis, the attorney-general of New York, who sent the evidence in his hands to the French government. Bolo's work was carried on not only in the United States, but in Canada, but no evidence is shown that his efforts to influence or purchase papers were successful. See *FRANCE, History*.

**THE UNITED STATES IN COUNCIL.** In the autumn of 1917, the United States had become sufficiently identified with the war operations, as an Ally, to make it necessary for representatives of the country to take part in the deliberations as to the proper conduct of the war. For an account of this participation see *WAR OF THE NATIONS*.

**EMBARGO AND BLOCKADE OF GERMAN TRADE.** The problem of dealing with neutral countries which bordered on Germany, and which normally obtained large food supplies from the United States, was one of the most vexing problems with which the American government had to deal. Extraordinary increase in these imports during the years of the war, made it evident that these countries were supplying immense quantities of stores to Germany, and thus prolonging the war. The president issued a proclamation declaring that after August 30, 1917, no exports from American ports could be shipped to any country in the eastern hemisphere except under a license granted by the Export Council. This restriction, so universal in application, was specifically aimed at the European neutral countries now trading with Germany. In an explanatory note accompanying the proclamation the president said:

"The purpose and effect of this proclamation is not export prohibition, but merely export control. It is not the intention to interfere unnecessarily with our foreign trade: but our own domestic needs must be adequately safeguarded, and there is the added duty of meeting the necessities of all the nations at war with the Imperial German government.

"After these needs are met, it is our wish and intention to minister to the needs of the neutral nations as far as our resources permit. This task will be discharged without other than the very proper qualification that the liberation of our surplus products shall not be made the occasion of benefit to the enemy, either directly or indirectly."

The embargo was later modified by the removal of the license ban from a number of commodities for export to countries other than Germany, her allies, and neutral nations bordering on Germany. The effect of this modification was to concentrate the embargo against Holland, Sweden, Norway, and Denmark, the countries from which Germany secured large quantities of supplies. Holland had previously

entered into an agreement with Germany which fixed the percentage of the exports from the Netherlands to the Central Powers, and to the nations at war with them. The United States government refused to recognize this agreement as equitable and intimated that while it was observed, no American commodities, including foods, cattle, fodder, and dairy products would be permitted to enter Holland. Holland clung to the agreement in order to obtain coal and other commodities from Germany. As a result of this embargo, a large number of Dutch and other neutral vessels loaded with grain and other food products, were held in New York harbor and elsewhere. The United States government refused to permit them to sail under conditions which enabled the cargo to take the place of food supplies from Holland to Germany. The United States proposed that these ships with the cargo be sent to the Allies or unloaded for American use, and that the vessels be placed in the American coastwise trade. The Dutch government refused, fearing the attitude that Germany would take if aid was given to her enemies. There were in all eighty-four Dutch ships held idle in American ports for six months, and they entailed expenses to their owners exceeding twenty-five million dollars. An arrangement had not yet been arrived at at the end of the year.

**DECLARATION OF WAR WITH AUSTRIA.** Relations between Austria and the United States by the latter part of the year had reached a delicate stage. Theoretically, the United States was not at war with Austria-Hungary, but as a matter of fact, no attempt was made to discriminate between that country and Germany, as far as actual hostilities were concerned. For an account of the relations between the two countries, from a diplomatic standpoint, see the section, *The Diplomacy of the War*, in the article **WAR OF THE NATIONS**.

Although no definite announcement had been made that war was to be declared with Austria-Hungary, there was no general surprise when President Wilson, in his annual address at the opening of Congress on December 3, asked Congress to declare war in the following words:

"One very embarrassing obstacle that stands in our way is that we are at war with Germany, but not with her allies. I therefore very earnestly recommend that the Congress immediately declare the United States in a state of war with Austria-Hungary. Does it seem strange to you that this should be the conclusion of the argument I have just addressed to you? It is not. It is, in fact, the inevitable logic of what I have said. Austria-Hungary is for the time being not her own mistress, but simply the vassal of the German government. We must face the facts as they are and act upon them without sentiment in this stern business. The government of Austria-Hungary is not acting upon its own initiative or in response to the wishes and feelings of its own peoples, but as the instrument of another nation. We must meet its force with our own and regard the Central Powers as but one. The war can be successfully conducted in no other way."

Congress at once began, in accordance with the president's request, to prepare a resolution of war, and a joint resolution was passed in the Senate and the House on December 7, 1917. The president thereupon issued the following proclamation:

Whereas the Congress of the United States, in the exercise of the constitutional authority vested in them, have resolved, by joint resolution of the Senate and House of Representatives bearing date of December 7, 1917, as follows:

Whereas the Imperial and Royal Austro-Hungarian government has committed repeated acts of war against the government and the people of the United States of America: Therefore be it

Resolved by the Senate and House of Representatives of the United States of America in Congress assembled, That a state of war is hereby declared to exist between the United States of America and the Imperial and Royal Austro-Hungarian government; and that the President be, and he is hereby, authorized and directed to employ the entire naval and military forces of the United States and the resources of the government to carry on war against the Imperial and Royal Austro-Hungarian government; and to bring the conflict to a successful termination all the resources of the country are hereby pledged by the Congress of the United States.

Whereas, by sections 4067, 4068, 4069, and 4070 of the Revised Statutes, provision is made relative to natives, citizens, denizens, or subjects of a hostile nation or government, being males of the age of 14 years and upwards, who shall be in the United States and not actually naturalized;

Now, therefore, I, Woodrow Wilson, President of the United States of America, do hereby proclaim to all whom it may concern that a state of war exists between the United States and the Imperial and Royal Austro-Hungarian government; and I do specially direct all officers, civil or military, of the United States that they exercise vigilance and zeal in the discharge of the duties incident to such a state of war; and I do, moreover, earnestly appeal to all American citizens that they, in loyal devotion to their country, dedicated from its foundation to the principles of liberty and justice, uphold the laws of the land and give undivided and willing support to those measures which may be adopted by the constitutional authorities in prosecuting the war to a successful issue and in obtaining a secure and just peace;

And, acting under and by virtue of the authority vested in me by the Constitution of the United States and the aforesaid sections of the Revised Statutes, I do hereby further proclaim and direct that the conduct to be observed on the part of the United States toward all natives, citizens, denizens, or subjects of Austria-Hungary, being males of the age of 14 years and upward who shall be within the United States and not actually naturalized, shall be as follows:

All natives, citizens, denizens, or subjects of Austria-Hungary, being males of 14 years and upwards, who shall be within the United States and not actually naturalized, are enjoined to preserve the peace toward the United States and to refrain from crime against the public safety, and from violating the laws of the United States and of the States and Territories thereof, and to refrain from actual hostility or giving information, aid, or comfort to the enemies of the United States, and to comply strictly with the regulations which are hereby or which may be from time to time promulgated by the president; and so long as they shall conduct themselves in accordance with law they shall be undisturbed in the peaceful pursuit of their lives and occupations, and be accorded the consideration due to all peaceful and law-abiding persons, except so far as restrictions may be necessary for their own protection and for the safety of the United States; and toward such of said persons as conduct themselves in accordance with law all citizens of the United States are enjoined to preserve the peace and to treat them with all such friendliness as may be compatible with loyalty and allegiance to the United States.

And all natives, citizens, denizens, or subjects of Austria-Hungary, being males of the age of 14 years and upward, who shall be within the United States and not actually naturalized, who fail to conduct themselves as so enjoined, in addition to all other penalties prescribed by law, shall be liable to restraint, or to give security, or to remove and depart from the United States in the manner prescribed by sections 4069 and 4070 of the Revised Statutes, and as prescribed in regulations duly promulgated by the president;

And pursuant to the authority vested in me, I hereby declare and establish the following regulations, which I find necessary in the premises and for the public safety:

(1) No native, citizen, denizen, or subject of Austria-Hungary, being a male of the age of 14 years and upwards and not actually naturalized, shall depart from the United States until he shall have received such permit as the president shall prescribe, or except under order of a court, judge, or justice, under sections 4069 and 4070 of the Revised Statutes;

(2) No such person shall land in or enter the United States, except under such restrictions and at such places as the president may prescribe;

(3) Every such person of whom there may be reasonable cause to believe that he is aiding or about to aid the enemy, or who may be at large to the danger of the public peace or safety, or who violates or attempts to violate, or of whom there is reasonable ground to believe that he is about to violate any regulation duly promulgated by the president, or any criminal law of the United States, or of the States or Territories thereof, will be subject to summary arrest by the United States marshal, or his deputy, or such other officers as the president shall designate, and to confinement in such penitentiary, prison, jail, military camp, or other place of detention as may be directed by the president.

This proclamation and the regulations herein contained shall extend and apply to all land and water, continental or insular, in any way within the jurisdiction of the United States.

In witness whereof, I have hereunto set my hand and caused the seal of the United States to be affixed.

Done in the District of Columbia this eleventh day of December, in the year of our Lord one thousand nine hundred and seventeen, and of the independence of the United States the one hundred and forty-second.

Following that, the attorney-general issued this statement:

"The proclamation issued by the president to-day, proclaims a state of war existing between this country and Austria-Hungary, and calls upon all citizens to perform their duty, warns subjects of the enemy to conform to our laws, and enjoins upon American citizens the duty of treating subjects of the enemy, who remain loyal to the United States, with all such friendliness as may be compatible with loyalty and allegiance to the United States.

"This proclamation differs from the preceding proclamation relating to the subjects of the German Empire in that, while it authorizes the arrest and internment of any subjects of the dual empire whose conduct may be a menace to the safety of the country, the only restrictions which it contains are prohibitions against either entering or leaving the United States without first obtaining permission.

"Many subjects of Austria-Hungary have already demonstrated their strong loyalty to this country by their faithfulness in industrial work, their organization of recruiting committees and in service with our armies. For the present, therefore, no restrictions will be placed upon the movements of subjects of Austria-Hungary. They are not subject to the restrictions of the previous proclamations relating to German enemy aliens; they will be permitted to reside and labor in prohibited areas and to travel freely without molestation. Only those who are dangerous or disloyal are subject to arrest."

**NAVAL ENGAGEMENTS BETWEEN AMERICAN AND GERMAN VESSELS.** The number of engagements reported between German and American vessels in European waters, from the time of the entrance of the American fleet into active participation in the war indicated a remarkable activity of the American naval squadrons. See **NAVAL PROGRESS; WAR OF THE NATIONS, Naval Operations; and SUBMARINE OPERATIONS.**

There were serious losses in the American merchant marine. The steamship *Campania* was sunk on August 6. The members of the armed guard of the steamship were taken prisoners by the Germans. The bark *Christiane* was sunk by a submarine in the vicinity of the Azores on August 7. The entire crew were saved and landed at Ponta Delgada. On June 27, the bark *Carmela* was sunk by a German submarine. The crew were saved and landed. The American ship *Kansan* was torpedoed on July 12. Three men were lost and the saved were landed. The American ship *Orleans*, which, with the *Rochester*, was the

first vessel to sail from the United States to Europe following the issue of the war zone decree by Germany, was sunk by a submarine. Four of the crew were drowned and all the members of the armed guard were saved, and were returned to the United States. The American ship *Grace* was sunk by a torpedo on July 16. Three were killed and five were injured. In the middle of July, three American ships were captured by a German raider, the *Seeadler*, in the vicinity of the Samoan Islands. These vessels were the *A. B. Johnson*, the *Manila*, and the *Sea Swan*. The bark *Hildegard*, of New Orleans, was sunk by a submarine on July 10. Two other ships, the *Mary W. Bowen*, and the *Massapequa* were sunk about the same time. On October 19, the American steamship *Luckenbach* was engaged by an enemy submarine. The armed guard was able to keep off the submarine until the arrival of an American patrol vessel. The *Luckenbach* was hit several times, but no serious damage was done to the ship. Seven of the crew and two members of the armed guard were wounded. Another ship belonging to the same company, the *Lewis Luckenbach*, was torpedoed and sunk on October 15. All the men were saved.

**RUSSIA AND THE UNITED STATES.** We have already indicated the interest taken by the United States government in the affairs in Russia, under the relations and the dispatch of the mission headed by Elihu Root. The mission returned to the United States in the first week in August, and at once made a report to the president. On August 25, Secretary Lansing, for the president, sent the following communication to the Russian Ambassador in response to a note from him transmitting a commission from the Russian minister of foreign affairs:

**EXCELLENCY:** I have the honor to acknowledge the receipt of your note of the 3d instant in which you transcribe a communication from the minister of foreign affairs of Russia to the government of the United States.

A translation of that communication has been furnished to the president, who, in full appreciation of the vast task confronting the provisional government of Russia in the reconstruction of that country and the reorganization of its forces, and of the energy with which that government is endeavoring, in the face of disloyalty and enemy-inspired propaganda, to uphold the good faith of Russia, welcomes the assurance now given by the provisional government of Russia of its intention, of which the president has had no doubt, of being deterred by no difficulty in pursuing the war to a final triumph. No less gratifying to the president is the announcement, by that government that, like the United States, Russia consecrates all its forces and all its resources to this end. With this tenacity of purpose moving all the allied governments, there can be no doubt of the outcome of the conflict now raging.

I ask you to be so good as to give to your government renewed expression of the president's deep sympathy with them in the burden they have assumed and in the obstacles they have encountered, and are encountering, and his confidence that, inspired and impelled by their patriotic efforts and guidance, there will emerge from the present conflict a regenerated Russia founded upon those great principles of democracy, freedom and equality, right and justice.

Accept, Excellency, the renewed assurances of my highest consideration.

The president on August 26 sent the following greeting to the members of the Russian National Council, which began its session on that day:

"President of the National Council Assembly, Moscow: I take the liberty to send to the members of the great council now meeting in Moscow

the cordial greetings of their friends, the people of the United States, to express their confidence in the ultimate triumph of ideals of democracy and self-government against all enemies within and without, and to give their renewed assurance of every material and moral assistance they can extend to the government of Russia in the promotion of the common cause in which the two nations are unselfishly united."

Aspects of the war, not covered in this article, are treated in other portions of the YEAR BOOK, as indicated by the cross-references given in the text above. See also AGRICULTURAL LEGISLATION; INTERNATIONAL ARBITRATION AND PEACE; RELIEF FOR WAR VICTIMS.

**UNITED STATES DEPARTMENT OF AGRICULTURE.** In his annual report for 1917 the secretary of agriculture deals principally with the activities of his department relating to food supply and conservation. He outlines some of the efforts of the department and its co-operating agencies to increase the production of foods and foodstuffs even before the entrance of the United States into the war and describes the action taken to bring about more effective organization and close coordination of the agricultural forces of the nation, beginning with the conferences with official agricultural representatives of the States at St. Louis, Mo., April 9 and 10, and at Berkeley, Cal., April 13. Largely as the result of these conferences Congress formulated and passed the Food Control Act establishing the Food Administration and the Food Production Act extending the work of the Department of Agriculture. The latter act carried an appropriation of \$11,346,400, mainly for promoting the enlargement of live stock production, conservation and utilization of animal products, control of animal and plant diseases and insect pests, purchase and sale of seeds, food supply surveys, marketing work, farm labor distribution, enlargement of the co-operative extension service, and increased publicity work. See AGRICULTURAL LEGISLATION; AGRICULTURAL EXTENSION WORK; AGRICULTURE.

**UNITED STATES MILITARY ACADEMY** (West Point, N. Y.). On July 1, 1917, the beginning of the academic year, there were 754 students and 105 instructors and administrative officers. Col. John Biddle was relieved as superintendent and commandant by Col. Samuel E. Tillman. Col. William B. Gordon, professor of natural and experimental philosophy, retired in 1917, and Lt. Col. Clifton C. Carter was appointed to succeed him. The library of the academy contains 100,000 volumes. The academy is maintained by congressional appropriation.

**UNITED STATES NATIONAL MUSEUM.** Various collections—historical, scientific, industrial, and artistic—belonging to the government are housed in the National Museum at Washington under the custody and supervision of the Smithsonian Institution (q.v.). Many of the explorers and investigators sent out by the institution are connected officially with the museum. During the fiscal year the building given by Charles L. Freer for his art collections was begun and by June 30, 1917, the foundations and concrete walls inclosing the sub-basement had been finished. The structure, covering 228 by 185 feet, will be of Milford granite and in design best adapted for its purpose. Mr. Freer gave \$1,000,000 for the art building, besides presenting to the nation his art collection. The division of the museum which has charge of this

collection is known as the National Gallery of Art.

Specimens to the number of about 200,000 were added during the year in the following departments: Anthropology; zoölogy; botany, geology and mineralogy; paleontology; textiles, woods, and other animal and vegetable products; mineral technology; and objects of art. Valuable additions were made in the field of American history. Through the field work of Dr. W. L. Abbot, of Capts. Wright and Cooper of Gen. Pershing's expedition to Mexico, and of Drs. Fewkes, Hrdlicka, and O. F. Cook, valuable collections were brought to the museum. Julius Hurter, Sr., of St. Louis, made a valuable bequest of reptiles and batrachians, and Mrs. Vanderbilt, of Biltmore, N. C., presented the museum with 25,000 botanical specimens and the remnant of the botanical library saved from the flood in July, 1916. There were about 400,000 visitors to the Natural History building during the year and about 250,000 to the Arts and Industries building.

**UNITED STATES NAVAL ACADEMY** (Annapolis, Md.). At the beginning of the academic year there were 1455 students (midshipmen) enrolled in the academy. The corps of instructors numbered 195. The library contains 55,600 volumes.

In 1917 Congress passed special legislation to authorize an additional appointment at the Naval Academy for each member of Congress. The law authorizes also the appointment of 100 enlisted men to be selected by competitive examination of enlisted men in the navy and marine corps who have been in the service for at least one year. All other qualifications to be identical with those required of midshipmen. Superintendent, Capt. Edward W. Eberle.

**UNIVERSALISTS.** On the first of January, 1917, this denomination had in the United States 662 ministers, 865 churches, and 58,300 members. The Sunday schools had over 50,000 pupils. The Commission on Social Service, established in 1910, carries on social work, and, in 1917, continued the task of stimulating interest in the subject among ministers, divinity students, men's clubs, women's societies, and young people's societies. Social service information is exchanged through the church press, and social service topics are discussed at the church gatherings. The denomination carries on missionary work in Japan and China. The institutions of higher education are: Tufts College; St. Lawrence University; Buchtel College; and Lombard College.

**UNIVERSITIES AND COLLEGES. STATISTICS.** *Attendance.* The latest available data for attendance are for the school year 1914-15. During that year there were enrolled in universities, colleges, and technological schools, 152,307 men and 84,861 women. In the undergraduate departments of the public institutions there were 62,384 men and 29,157 women, and in the graduate departments 3473 men and 1783 women. In the private institutions there were in the undergraduate departments 79,452 men and 50,606 women. Students in engineering courses were as follows: General engineering 6166, chemical engineering 2383, electrical engineering 6637, mechanical engineering 7751, civil engineering 6637, and in mining engineering 1922.

*Effect of the War on Attendance.* Several of the larger institutions have issued re-

ports of attendance during the first semester of 1917-18. The losses have been as follows: Columbia University, 15 per cent; Cornell University, 30 per cent; Harvard University, 40 per cent; Iowa State College, 20 per cent; Ohio State College, 16 per cent; Princeton University, 40 per cent; University of California, 11 per cent; University of Chicago, 19 per cent; University of Illinois, 20 per cent; University of Michigan, 20 per cent; University of Pennsylvania, 22 per cent; and Yale University, 34 per cent. The Massachusetts Institute of Technology has issued the following facts regarding the enrollment in that institution: Freshmen, as compared with last year, 104 per cent; sophomore class, 93 per cent; junior class, 75 per cent; and senior class, 86 per cent. In chemical engineering there is an increase of 12 per cent, while in architecture and mechanical engineering there are decreases of 30 and 21 per cent respectively.

*Instructors.* In the collegiate departments there were 17,605 men and 4048 women instructors. In the professional departments there were 7342 men and 84 women instructors.

*Degrees.* During the school year ending in June, 1915, there were 29,608 baccalaureate, 4140 graduate, and 833 honorary degrees conferred. Among the first degrees 11,229 were conferred in art and sciences, 2027 in agriculture, 1354 in civil engineering, 1135 in mechanical engineering, and 1063 in electrical engineering.

*Finances.* The universities, colleges, and technological schools reported an income of \$118,299,296. Of this amount \$23,603,919 were received from tuitions and other educational services, \$18,246,427 from productive funds, from State or city \$30,686,906, from the United States government \$5,660,732, and from private benefactions \$20,310,115. These institutions report property as follows: Library, scientific apparatus, machinery, and furniture, \$75,197,504; grounds \$86,271,597; buildings \$292,698,592; and productive funds \$393,366,407.

*Gifts and Bequests.* The aggregate of gifts and bequests, excluding grants by the United States, different States, and municipalities, reported for the school year ending June, 1915, was \$29,310,124. Of this amount \$5,984,635 was for increase of plant, \$3,556,419 for current expenses, and \$10,769,070 for endowment.

**ACADEMIC FREEDOM.** During 1917 instructors in several institutions were either dismissed or subjected to trial on account of conduct or expression of views which were contrary to the policy of the institutions in which they taught. Attention was particularly focused on Columbia University. During the early part of October the trustees of that institution dismissed Dr. J. McKeen Cattell from the chair of psychology which he had held since 1891 and Dr. Henry Wadsworth Dana, assistant professor of English. This action was followed by the resignation of Dr. Charles A. Beard, professor of politics, and head of the department of political science. The immediate cause of Dr. Cattell's dismissal was certain letters that he had written to members of Congress urging them to oppose the sending of conscripts to Europe. For several years Dr. Cattell had not been in complete sympathy with the government of the university. He had urged a more democratic form of organization and in various ways had

undoubtedly had a disturbing influence in the faculty. Dr. Dana had been especially active for peace as a member of the People's Council. The trustees believed that the reputation of the university had been affected by the conduct and utterances of these instructors and accordingly they were dismissed. A committee of the faculty had considered these cases and it is understood were agreed that the connection of these instructors with the university should be severed. They did not, however, approve such drastic action as was taken by the trustees. Meanwhile reports had been in circulation that certain other Columbia instructors had given expression to views that were interpreted as pro-German. Dr. Beard was one of this number. A committee of the trustees considered his case and found no causes for action. Both trustees and faculty, however, were now confronted with the problem of just what freedom an instructor should have, particularly in such times as the present. Dr. Beard took exception to the attitude of the trustees and, following the dismissal of Dr. Cattell and Dr. Dana, tendered his resignation on October 8 to take effect the next morning. The letter in which he conveyed his resignation was made public. He urged his complete loyalty to the country, but expressed disapproval of the attitude of the trustees. He said: "I am convinced that while I remain in the pay of the trustees of Columbia University I cannot do effectively my humble part in sustaining public opinion in support of the just war on the German Empire or take a position of independence in the days of reconstruction that are to follow. For this reason I herewith tender my resignation as professor of politics."

The resignation of a professor who had held so prominent a position as Dr. Beard and who had been so popular with his colleagues created among a considerable number of the faculty members a feeling of unrest and dissatisfaction. The opinion was expressed that members of the teaching force should not be subject to dismissal without the approval of a committee of the faculty.

Early in 1917 the University Council, which at Columbia, next to the trustees, is its highest governing body, adopted the recommendations of a committee of nine deans and professors who were appointed to consider teaching conditions at the university. These recommendations called for the creation of a standing committee to be known as the Committee of Reference. This body was to concern itself with all matters affecting the relation of an officer of the university to his colleagues, the president, or the trustees. The Trustees' Committee on Education was requested before taking action with reference to the dismissal of any officer to confer with this body. The recommendations of the council were not approved by the trustees at that time. Later, however, the trustees adopted a joint report made by the Committee of Education and by a special Committee on the State of Teaching. The report recommends a Reference Committee of nine members, whose duties shall be "to consider any question that may arise as to the conduct or efficiency of any officer of administration or instructor and to report thereon to the trustees through the president." The report states that "in the whole history of Columbia University there has been no instance

where the trustees have ever subjected any teacher to restriction or discipline by reason of his classroom teaching." Appointment "presupposes that the appointee is a gentleman and a man of character; that he is competent to teach his subject or to direct research in it; that he will teach that particular subject to the best of his ability and in his teaching not deal with matters wholly unrelated to that subject; and, finally, that he will recognize his fealty to the university, and will make his duty to the university a first consideration in all his action." "This relation of confidence necessarily terminates 'when the conduct or utterances of any academic officer, either within or without the university, imperil its influence or reputation or are inconsistent with his implied pledge in accepting appointment.'" "The Joint Committee concurs with the opinion expressed by President Butler, in his annual report for 1910, that freedom implies responsibility and that academic freedom is naturally subject to the 'limitations imposed by common morality, common sense, common loyalty, and a decent respect for the opinions of mankind.'"

Much has been written in reference to the university's responsibility for the instructor's freedom, both inside and outside the classroom. President Lowell of Harvard, in his report for 1916-17, holds that the professor's classroom utterances on his own subject "ought to be absolutely free." The instructor should also be free to publish the results of research, provided they are in scholarly form. The instructor is not, however, at liberty to consider in his classroom subjects that do not relate to his specialty. President Lowell believes that it is unwise for an institution to attempt to assume responsibility for the actions and utterances of instructors outside their own classrooms. He says, "There is no middle ground. Either the university assumes full responsibility for permitting its professors to express certain opinions in public, or it assumes no responsibility whatever, and leaves them to be dealt with like other citizens by the public authorities according to the laws of the land."

President Schurman of Cornell University, in his annual report, touches upon the question of academic freedom. He says, "The year 1917-18 is likely to test severely the academic belief in and devotion to the doctrine of academic freedom of thought and speech. Perhaps no institution in the land has insisted on it more strenuously than Cornell. On that account it is especially incumbent on the Cornell community, while continuing to adhere inflexibly to their views on academic freedom, to recognize the duties and proprieties which the just assertion of this fundamental right necessarily involves especially in time of war." . . . "Abuses of academic freedom are not anticipated at Cornell, but should they unfortunately occur the policy of professorial representation on the board of trustees, which has justified itself so thoroughly by the experience of the year, is likely to enable the authorities to deal more justly and wisely with the matter than would seem to be possible in the case of universities in which the board of trustees or governing body is absolutely divorced from the faculty."

CARNEGIE FOUNDATION FOR THE ADVANCEMENT OF TEACHING. The eleventh annual report of the president and treasurer of the Carnegie

Foundation for the Advancement of Teaching shows that the general endowment amounts to \$14,164,000. The endowment for the Division of Educational Enquiry is \$1,250,000. For the year ending September 30, 1916, the trustees received an income for general purposes of \$800,322.84. The income from the endowment of the Division of Educational Enquiry was \$50,313.23. The expenses chargeable to General Endowment were \$731,413.76. Of this amount \$479,923.91 was for retiring allowances and pensions for officers and pensions in the institutions on the "Associated List," and \$83,839.91 was for allowances and pensions to individuals. The expenses of the Division of Educational Enquiry were \$47,992.88. During the year 30 pensions were granted to officers and teachers and 16 allowances were granted to the widows of officers and teachers. The general average of the retiring allowances of officers and teachers was \$1703.59. The foundation had a total of 458 allowances in force and the annual grant for this purpose was \$711,443.

THE MAYO FOUNDATION FOR MEDICAL INVESTIGATION AND RESEARCH. After a two-year trial the Board of Regents of the University of Minnesota ratified by unanimous vote the permanent agreement making the Mayo Foundation for Medical Investigation and Research the absolute property of the university. In accepting the gift the regents adopted the following resolutions:

*Whereas*, Dr. William J. Mayo and Dr. Chas. H. Mayo, of Rochester, Minn., have given the sum of \$1,650,344.79 to the University of Minnesota for the establishment of a fund to be known as the "Mayo Foundation for Medical Education and Research," and,

*Whereas*, This gift has been duly accepted by unanimous action of the board of regents,

*Therefore, be it Resolved*, That the board of regents records its profound sense of gratitude to the donors. The gift is unique in the annals of American education. It represents the lofty purposes of two of the most distinguished citizens of our commonwealth. They believe that this money has come from the people and that it should be returned to the people. It has been the sole aim of the donors to provide a fund which would be of permanent benefit to the State of Minnesota and to mankind as a whole. They have wisely and appropriately provided that the income of the fund shall be used for medical education and research. American universities should be encouraged in the prosecution of an educational policy which aims to develop investigators and scientists of the first rank. One clear function of a true university is to make actual contributions to various fields of knowledge. This new foundation, therefore, relates itself very intimately to the realization of our highest educational aims. Both for the gift itself and for the genuine impetus which it will impart to scholarly investigation in this university, we desire to convey to the donors our sincere appreciation.

In making this gift the Doctors Mayo have turned over their savings of a generation, also they pay the expenses of the foundation until a fund of \$2,000,000 has been raised. Ten per cent of the yearly income may be used within and a like sum outside the State to investigate epidemics. After twenty-eight years the foundation may be moved to any other place within the State.

NEW PRESIDENTS. During the year 1917 the following college presidents were elected: Dr. Melvina Brannon was made president of Beloit College; Alfred Hall-Quest was elected president of Cincinnati College for Teachers; Dr. C. A. Duniway of University of Wyoming has

accepted the presidency of Colorado College; Professor Benjamin T. Marshall was installed as president of the Connecticut College for Women; Drew Seminary for Women elected Clarence Paul McClelland as president; Professor Charles E. Goodell was made president of Franklin College; Dr. Frederick C. Ferry, formerly dean of Williams College, was elected president of Hamilton College; Dr. Ernest H. Lindley, professor of psychology at the University of Indiana, has been elected president of the University of Idaho; Dr. Frank L. McVey accepted the presidency of the University of Kentucky; Dr. Henry W. Tuttle was made president of Kingfisher College; Dr. Marion LeRoy Burton, president of Smith College since 1909, has been elected president of the University of Minnesota; Edward O. Sisson was made president of the University of Montana; Walter E. Clark was elected president of the University of Nevada; Ralph D. Hetzel was chosen president of New Hampshire College; Wallace Carl Riddick was installed as president of North Carolina College of Agriculture and Mechanic Arts; Dr. Edward Everett Rall was installed as president of Northwestern College; Dr. Silas Evans, president of Ripon College, has been elected president of Occidental College; Dr. Calvin G. French has been elected president of Rollins College; Dr. Lorin Stucky, professor of sociology and economics at the University of Iowa, has been elected president of Sayre College; Dr. William Allan Neilson, professor of English at Harvard, was elected president of Smith College; the Rev. Dr. Arthur Cushman McGiffert has been elected president of Union Theological Seminary; Frederick A. Hall was elected chancellor of Washington University to succeed Dr. David F. Houston. Dr. William Miller Collier succeeds Rear Admiral Charles Herbert Stockton as president of George Washington University.

**PROFESSIONAL SCHOOLS.** The schools of theology, law, medicine, dentistry, pharmacy, and veterinary medicine reported for the year ending June, 1915, buildings and grounds valued at \$67,314,427. They had endowment funds amounting to \$65,386,866, of which \$39,232,872 were for schools of theology and \$23,251,380 for schools of medicine. The total benefactions received during the year were \$4,226,296. The number of students enrolled was 66,055. The corresponding enrollments in 1910 and 1905 were 67,355 and 60,322 respectively. The number of students who entered the professional schools after graduation from college was 11,521 in 1915, 9349 in 1910, and 9054 in 1905. It will be noticed that the number of college graduates who attend the professional schools has gradually increased, although the total enrollment of 1915 is less than that of 1910.

Between 1910 and 1915 the number of students decreased in the schools of theology, medicine, and pharmacy. During the same period there were increases in the schools of law and dentistry. The increases in the number of women students in law and dentistry are noteworthy. In all of the other schools the number of women students has decreased, being most pronounced in medicine.

The following table shows the number of schools of each class, the number of men and women students, the number of graduates and the per cent of students who held college degrees for the years 1915, 1910, and 1905.

Class	Year	Schools	Students			
			Men	Women	Graduates	Per Cent Having Degrees
Theology	1915	104	10,185	453	1,872	39
	1910	184	10,527	491	1,759	37
	1905	166	7,411	169	1,518	34
	1915	120	21,824	599	4,427	18
Law	1915	110	19,362	205	4,233	21
	1905	96	14,548	168	3,435	22
	1915	93	14,047	635	3,745	19
	1915	135	20,687	707	4,448	9
Medicine	1915	148	24,743	1,092	5,544	11
	1915	50	9,452	195	2,236	27
	1910	53	6,346	93	1,588	35
	1905	54	7,049	100	2,612	24
Dentistry	1915	75	5,805	302	1,838	13
	1910	79	5,937	289	1,715	7
	1905	67	4,745	199	1,518	14
	1905	67	4,745	199	1,518	14

**TEACHERS' INSURANCE AND ANNUITY ASSOCIATION.** The experience gained during the first ten years of the existence of the Carnegie Foundation for the Advancement of Teaching indicated that it was not possible or wise to continue the support and maintenance of a pension system under such rules as the trustees had previously determined. The trustees of the foundation had from the beginning retained the power of altering the rules governing pensions in such manner as experience might indicate as desirable. After communicating with the instructors in all of the institutions concerned it seemed advisable to the trustees to carry out the contracts already made with instructors, but in the future to use a part of the funds of the foundation in defraying the expenses of conducting a Teachers' Insurance and Annuity Association. In this way insurance and annuity contracts may be offered on the most favorable terms to teachers and at net cost. It is proposed to organize under the insurance laws of the State of New York. The association will have a capital of \$500,000 and a surplus of \$500,000. This capital and surplus will be provided through the Carnegie Foundation for the Advancement of Teaching. The by-laws of the association will provide for a policy holders' committee of five with power to make a full annual investigation of the affairs of the association. The association will issue to college teachers two kinds of policies: 1. Policies of term insurance expiring at the age of sixty-five, designed to cover the risk of death prior to the assumed age of retirement; 2. Deferred annuity policies under which the annuity payments will begin at age sixty-five. See AMERICAN UNIVERSITY UNION.

**UPPER AUSTRIA.** A crownland of Austria. Area, 4626 square miles. Population at 1911 census, 853,006 (2.99 per cent of the Austrian total). Austrian subjects, 843,146; of these, German was the vernacular of 840,604 (99.70 per cent). Catholics formed 97.31 per cent of the population, and Evangelicals 2.48 per cent. Capital, Linz. The crownland has a diet of 69 members and is represented by 22 members in the Austrian Reichsrat.

**UPPER SENEGAL AND NIGER.** One of the constituent colonies of the government-general of French West Africa (q.v.).

**UPSHUR, JOHN HENRY.** Rear Admiral, U. S. N., retired. He was born in Northampton County, Va., on December 5, 1823, and died at Washington, D. C., on May 30, 1917. His father

er's name was Nottingham, but as he died very shortly after his son's birth he assumed his mother's family name. He was graduated from the United States Naval Academy in 1848, having seen service in the Mediterranean, Brazil, and Gulf of Mexico. He was present at the siege of Vera Cruz, in the Mexican war. He became a lieutenant in 1855 and had accompanied the Perry expedition to Japan. During the Civil War he served in the North and South Atlantic Squadrons, being present at the capture of Fort Hatteras, Port Royal, and Fort Fisher. Lieutenant commander in 1862; commander of flagship on the North Atlantic Squadron in 1864; commander in 1866; captain, 1872; commodore, 1880; rear admiral, 1884. After 44 years of service he was retired at his own request in 1885. He had the distinction of being the oldest retired naval officer and the oldest living graduate of the Naval Academy.

**URANUS.** See ASTRONOMY.

**UREASE.** An enzyme found in certain beans (notably the Jack bean, *Canavalia ensiformis*), fungi, and microorganisms. It is employed in determining the amount of urea in the urine, blood, and other body fluids. In the presence of water, urease converts urea into ammonium carbonate.

**URUGUAY.** A South American republic, bounded by Brazil and Argentina. The capital is Montevideo.

**AREA AND POPULATION.** The republic consists of 19 departments, whose area, as officially estimated, is 186,926 square kilometres (72,172 square miles). This area is nearly equivalent to the gross area of New York, Vermont, Massachusetts, and Connecticut (71,999 square miles). The census of October, 1908, returned a population of 1,042,686 (530,508 males, 512,178 females). Estimated population, December 31, 1915, 1,346,161; December 31, 1916, 1,378,808; increase in 1916, 32,647, of which 16,002 is excess of arrivals over departures and 16,645 excess of births over deaths. In 1915 and 1916, marriages numbered 5758 and 5889 respectively; births, 38,046 and 39,963; deaths, 16,602 and 23,318. Estimated population of Montevideo at the end of 1916, 373,964. Montevideo, whose inhabitants in 1908 numbered 291,465, had an estimated population of 373,964 at the end of 1916. Paysandú had in 1908 20,953 inhabitants; Salto, 19,788; Mercedes, 15,667. Other towns of some importance are Melo, San José, Rocha, and Fray Bentos, where is located the dried meat and extract establishment of the Liebigh Company.

**EDUCATION.** Of the population over five years of age, about 39.8 per cent, according to the 1908 census, were illiterate. Primary instruction is nominally compulsory. In 1916, public primary schools numbered 1014, with 99,882 pupils enrolled and an average attendance of 74,184. There are about 200 private schools, with about 19,000 pupils. There are several secondary and special schools, many religious seminaries, and there is a university at Montevideo.

**PRODUCTION.** The cultivation of grains at present is largely confined to land along the coast and in the vicinity of rivers. In 1916, locusts and a prolonged drought (one of the worst on record) did great havoc to crops. Following are reported yields, in bushels, for the years 1914-17:

	1914-15	1915-16	1916-17
Wheat .....	3,595,558	9,867,277	5,390,228
Corn .....	11,381,686	4,603,826	.....
Oats .....	933,231	2,233,044	1,926,258
Barley .....	39,588	115,402	110,308
Linseed .....	588,114	390,600	121,916
Canary seed... *	1,241,000	2,943,200	1,286,600

\* Pounds.

The raising of live stock constitutes the greatest source of wealth. The 1908 live stock census returned 8,192,602 cattle, 26,286,296 sheep, and 556,307 horses. Subsequent estimates surpassing these figures may be substantially correct, but undoubtedly in the last few years there has been a decline. Excessive rains in 1914 caused much disease and heavy mortality among animals. An investigation made in that year showed that between 600,000 and 700,000 cattle and more than 5,000,000 sheep died from disease and starvation. It is estimated that the drought of 1916 caused the death of 1,500,000 cattle. Estimates based on the amount of sheep dip consumed put the number of sheep in the country in 1912 at 33,000,000; January 1, 1915, 18,000,000; January 1, 1916, 13,000,000. These figures, of course, may be far from correct. However, inasmuch as all sheep are dipped and the consumption of dip per sheep is fairly regular, the total quantity of dip used should give a fairly approximate idea of the size of the flocks. It should be noted also that wool shipments from Montevideo fell from 70,411 tons in 1912 to 22,745 tons in 1916.

**COMMERCE.** The values of imports given in Uruguayan statistics are based not on the actual market or invoice values of merchandise, but on the value officially fixed for customs purposes. Import statistics, failing to take into account price changes, do not convey, particularly since the outbreak of the great war, a correct idea of the import trade. Official values of exports were used in statistics until 1913; since then returns have been based on market values. Imports and exports, as reported in pesos (peso = \$1.03424), have been as follows:

	1913	1914	1915	1916
Imps. ..	48,717,307	37,234,877	34,979,639	33,802,992
Exps. ..	62,636,538	58,233,699	73,290,671	68,340,648

Details of articles of trade for 1916 are not available. In 1915, grazing and the meat industry furnished exports valued at 70,535,539 pesos; exports of meats and extracts amounted to 126,821 tons, valued at 30,333,922 pesos; wool, 37,904 tons, 20,089,178 pesos; hides and skins, 16,663,120 pesos.

In 1916, imports from and exports to the United Kingdom were valued at \$7,046,889 and \$13,827,770 respectively; United States, \$4,325,940 and \$10,672,125; France, \$1,752,683 and \$12,677,241; Spain, \$2,443,778 and \$3,049,175. For the first half of 1917, reported imports, \$19,317,152, and exports, \$49,274,343.

**COMMUNICATIONS.** The length of railway open to traffic is over 1600 miles. Only about 41 miles are state-owned. The three principal systems—the Central, the Midland, and the East Coast—comprise nearly 95 per cent of the mileage; they have been financed, built, owned, and managed by British interests. In 1917, there was under consideration a plan to extend the

railway system which would involve appropriations from the government to the amount of more than \$10,000,000. Telegraphs: About 2700 miles of line, with about 5400 miles of wire, and about 60 offices. Post offices, over 1000.

**FINANCE.** The legal standard of value is gold. The monetary unit is the peso, equivalent to \$1.03424. The budget for the fiscal year 1916-17 showed estimated revenue of 29,086,428 pesos and estimated expenditure of 29,406,445 pesos. (For details, see 1916 YEAR BOOK.) On account of the abnormal economic situation due to the great war, a budget for 1917-18 could be only guess-work, and the estimates for 1916-17 were continued. The public debt at the end of 1915 was 147,559,589 pesos, consisting of the foreign consolidated debt of 121,077,787 pesos, the internal debt of 24,346,302 pesos, and the international debt of 2,135,500 pesos. Service of the debt in 1915, 7,776,947 pesos (including for redemptions 790,367 pesos and for railway guarantees 918,704 pesos).

**GOVERNMENT.** The legislative power is exercised by a congress of two chambers, the Senate and the House of Representatives. Senators (19 in number) are elected by indirect vote for six years; representatives (90), by direct vote for three years. The president is elected for four years by the congress and is ineligible for the next term. President for the term ending March 1, 1919, Feliciano Viera.

**UTAH. POPULATION.** The population of the State in 1910 was 373,351, and on July 1, 1917, it was estimated to be 443,866.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. Bu.	Value
Corn ..... 1917	20,000	500,000	\$850,000
1916	18,000	429,000	493,000
Wheat ..... 1917	320,000	5,650,000	10,057,000
1916	326,000	6,900,000	10,488,000
Oats ..... 1917	100,000	4,400,000	3,740,000
1916	103,000	4,480,000	2,733,000
Potatoes ... 1917	23,000	4,347,000	3,391,000
1916	20,000	3,600,000	4,680,000
Hay ..... 1917	392,000	1,137,000	17,055,000
1916	384,000	845,000	12,675,000

a Tons.

**MINERAL PRODUCTION.** The coal production was 3,567,428 net tons, valued at \$5,795,944, which is the record production up to this time. This was an increase of 458,713 tons, or 15 per cent in quantity and of \$879,028, or 18 per cent in value. Except for short periods of car shortage, the transportation facilities were ample for the first ten months of 1916, but in November and December the car supply was reduced, and the production was somewhat curtailed. In the latter part of the year there was a considerable shortage of labor. The consumption of Utah coal by the railroads increased, and the market on the Pacific Coast was extended largely by reason of the decrease in the water-borne fuel from Australia and Japan, and from the Atlantic Coast of the United States. The activity of the smelter and metal mines was a large factor in causing the increased output of both coal and coke.

The mining in Utah established a new record in 1917 in value. The output of gold, silver, copper, lead, and zinc had a total value of over \$106,000,000, according to the estimates of the

United States Geological Survey. This is an increase of nearly \$17,000,000 over the record made in 1916. Gold, lead, and zinc showed decreases in output, while the output of silver and copper increased. About 15,000,000 tons of ore were mined in 1917, compared with 13,920,643 tons in 1916. The gold output decreased from \$3,574,947 in 1916 to about \$3,489,000 in 1917. The production of silver increased from 13,253,037 ounces in 1916 to about 14,385,000 ounces in 1917, amounting to an increase of nearly \$3,000,000. The copper production of the State in 1917 broke all records, increasing from 240,275,222 pounds in 1916 to nearly 245,000,000 in 1917, an increase of nearly 2 per cent in quantity, but over \$12,000,000 in value. The lead production decreased from 201,490,075 pounds in 1916 to over 193,000,000 pounds in 1917. The value increased more than \$3,000,000. The recoverable zinc amounted to about 22,000,000 pounds, compared with about 29,500,000 pounds in 1916. The value decreased from \$3,962,719 in 1916 to slightly more than \$2,000,000 in 1917.

**TRANSPORTATION.** The railway mileage in 1915, the latest for which statistics are available, was 2354. The railroads having the longest mileage were: The Denver and Rio Grande, 762; the Central Pacific, 273; the Oregon Short Line, 242; San Pedro, Los Angeles, and Salt Lake, 498; Western Pacific, 121; the Union Pacific, 75.

**FINANCE.** The report of the State treasurer shows the receipts for the fiscal year of 1917 to be \$6,097,526. The expenditures were \$6,287,635. There was a balance in the treasury at the beginning of the year amounting to \$1,414,070, and at the end of the year \$1,223,960. The bonded debt of the State was \$411,362.

**EDUCATION.** The total school population in 1917 was 132,424. The total enrollment in the public schools was, in 1916, 108,359. The total expenditure for school purposes during the year was \$4,701,164.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the State Industrial School, the State Mental Hospital, the State Prison, and the State School for the Deaf and Blind.

**POLITICS AND GOVERNMENT.** On June 24, a break in the great concrete dam of the Price River Irrigation Company, in San Pete County, flooded the farm land region, and compelled the temporary abandonment of four villages. The rapid inflow of melted snow increased the pressure of the water, and a section of the core of the dam, fifty feet wide and five feet high, was carried away. It was found impossible to repair the damage, and loss of life was prevented only by sending early word to homes and farms in the path of the flood.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below. Several important amendments were made to the laws relating to the administration of State government. A budget system for preparing and enacting annual appropriations was created. A general prohibition law becoming effective on April 2, 1917, was passed. Amendments were also made to the laws forbidding the introduction of liquor into any territory within the State. An amendment providing for constitutional prohibition was proposed. An industrial commission was cre-

ated in which is centred the enforcement of various labor laws heretofore administered by independent agencies. This body also has charge of the Workingman's Compensation Law passed by the legislature. The laws relating to labor disputes were amended. Provision was made for a jury trial for a person accused of contempt of court. The child labor laws were amended in important details. Laws affecting property were also amended. A commission was appointed for the purpose of investigating the conservation and better utilization of the water resources and of controlling waters in floods. All public school houses are declared to be public centres where citizens may meet and discuss any and all subjects or questions relating to educational, economic, artistic, and other interests of the citizens.

**STATE OFFICERS.** Governor, Simon Bamberger; Secretary of State, Harden Bennion; Attorney-General, D. B. Shields; Treasurer, D. O. Larson; Auditor, Joseph Ririe; Superintendent of Public Instructions, E. G. Gowans—all Democrats.

**JUDICIARY.** Supreme Court: Chief Justice, J. E. Frick; Justices, W. M. McCarty and E. E. Corfman; (S. R. Thurman, Valentine Gideon, appointed by governor under new law). Clerk, H. W. Griffith.

**UTAH, UNIVERSITY OF.** A co-educational State institution at Salt Lake City, Utah. In the fall of 1917 there were 1834 students and 135 members of the faculty; 103 students and one member of the faculty left to enter government service. George Thomas, director of the Farm Loan Bank, Berkeley, Cal., was added to the department of economics. The library contained 50,215 bound volumes and 19,775 pamphlets. Productive funds in 1917 amounted to about \$350,000. The university was founded in 1850. President, John A. Widtsoe, LL.D.

**UULYANOFF, VLADIMIR ILTYCH.** The real name of Nikolai Lenine (q.v.).

**VACCINE THERAPY.** During the past few years there has been a growing suspicion which has gradually become a conviction in the minds of many bacteriologists and clinicians that vaccines are not specific; that is to say, the beneficial effects observed after the injection of vaccine may be due to the reaction of the body against any foreign protein injected into the tissues, rather than to the stimulation excited by the specific toxin of the particular bacterium involved in the case. Joseph J. Miller of Chicago, in a comprehensive review of the subject, cites for example, the case of typhoid fever. He says that study of the accumulated statistics of typhoid does not point to the conclusion that the subcutaneous administration of vaccines has materially modified the course of the disease. The same may be said of colon bacillus infection, acute or chronic rheumatism, whooping-cough, bacillary dysentery, etc. Furthermore, it has not been demonstrated that the results were due to the specific character of the vaccines. Ichikawa and others, by giving typhoid vaccine intravenously, were able to terminate, usually by a single injection, about 20 per cent of their cases by crisis and about 20 per cent by rapid lysis. But these observers very early determined that the reaction was not specific, for they found that typhoid vaccine worked equally well in paratyphoid fever and that equally good results could be obtained with a

colon vaccine, so long as the vaccine was given intravenously. Fraenkel treated fifty-seven typhoid patients with subcutaneous injections of killed typhoid bacilli, and reported that the disease was favorably modified; but Rumpf, his associate, used the bacillus pyocyanus with equally favorable results in another series of cases. From the interchangeability of the bacterial proteins the transition was easy for the trial of animal and vegetable proteins. Vaughan several years ago observed that it was possible to produce a transitory immunity to the colon bacillus in animals by using peptone or egg albumin, and this immunity was apparently as lasting as that induced by injections of the colon bacillus vaccine. Ludke experimented in typhoid with a 4 per cent solution of deuterio-albumose administered intravenously. The results obtained compared favorably with those derived from typhoid vaccine, thus showing that not only were the vaccines not specific, but that similar results could be achieved by using a nonbacterial foreign protein. Still more recently, Saxl has used intramuscular injections of sterilized milk. There is also considerable evidence to show that not only foreign proteins, but other substances, will markedly influence the course of typhoid when injected into the tissues. Thus Mittlander treated 300 cases of typhoid by intravenous injection of caffeine and camphor. The essential elements seem to be that there should follow a reaction of chill and temperature. Janeway cites a case of rapid termination by lysis in a typhoid patient who had a chill, following transfusion of blood for hemorrhage. Among the foremost experimenters in this department are Jobling and Petersen, who employ chiefly typhoid vaccine and proteose. In Germany, the favorite substances are sterilized milk and sodium nucleinate. Sterilized milk, normal horse serum, colon bacillus, meningococcus and gonococcus vaccines, tuberculin, collargol, and typhoid vaccine have been given in various forms of joint diseases by different observers. Kraus used colon vaccine in puerperal sepsis; Ziembowski injected milk in sepsis and tuberculosis; milk has been used by others in conjunctivitis, iritis, and trachoma; and typhoid vaccine has been used successfully in lupus and psoriasis. Staphylococcus vaccine has shown results equal to those obtained by the use of pollen in hay-fever. Miller, whose article we quote, has treated at the Cook County Hospital, Chicago, 175 cases of acute and chronic arthritides, using typhoid vaccine almost exclusively, but in a few cases proteose and chicken serum. As a rule the injections were given intravenously. Shortly after the injection there is a chill, rise in temperature to 104° or 105° F. lasting a few hours. During the violent reaction there is usually a diminution of the polymorphonuclear cells of the blood, but this is followed by a leukocytosis, which may reach 100,000 or more, but usually runs between 15,000 and 20,000. Of a series of 93 patients with acute arthritis treated, 80 were either relieved of their pain or greatly benefited after receiving from one to four injections, given daily; 6 showed moderate improvement; 7 were not benefited. In the majority of cases there was no recurrence, but a few patients had a mild return of symptoms which were abolished by another injection.

**VALUATION.** See RAILWAYS.

**VANDERBILT UNIVERSITY.** A co-educational

tional non-sectarian institution located at Nashville, Tenn. In the fall of 1917 there were 755 students and 145 members of the faculty. Volumes in the library numbered 62,000. St. George L. Sioussat of the department of history resigned during the year to go to Brown University and Walter L. Fleming was elected head of the department. Productive funds in 1917 amounted to \$3,168,000 and the income therefrom to \$150,000. The campaign for the successful securing of an addition of \$1,000,000 to the endowment was brought to a successful conclusion; the largest contributors to this fund being the General Education Board, Mr. W. K. Vanderbilt, and Mr. F. W. Vanderbilt. The university was founded in 1872. Chancellor, J. H. Kirkland, LL.D.

#### VARIABLE STARS. See ASTRONOMY.

**VASSAR COLLEGE.** A non-sectarian institution for the education of women, located at Poughkeepsie, N. Y. In the fall of 1917 there were 1129 students and 140 members of the faculty. Volumes in the library numbered 96,000. Productive funds in 1917 amounted to \$2,330,000 and the income therefrom to \$80,000. The most notable benefaction received during the year was the fiftieth anniversary fund of \$1,050,000. The college was founded in 1861. President, Henry Noble McCracken, LL.D., L.H.D.

#### VEGETABLES. See HORTICULTURE.

**VENETIA.** A compartimento of Italy, occupying the northeastern part of the country. It is bounded on the north by the Austrian crownlands of Tirol and Carinthia, and on the east by the Austrian crownland of Görz and Gradisca; on the southeast it is bordered by the Gulf of Venice. Venetia consists of eight provinces, as follows: Belluno, Padova (Padua), Rovigo, Treviso, Udine, Venezia (Venice), Verona, and Vicenza. The area of the compartimento is 9478 square miles, which is almost exactly the same as the combined area of New Jersey and Delaware. The population according to the census of June 10, 1911, was 3,527,360, as compared with 3,134,467 in 1901; as estimated January 1, 1915, 3,732,941. The capital, and the capital of Venezia, is Venice, which at the beginning of 1915 had an estimated communal population of 168,038. Estimated communal population of other provincial capitals, January 1, 1915: Padua, 105,135; Verona, 86,448; Vicenza, 57,016; Udine, 49,695; Treviso, 43,597; Belluno, 22,261; Rovigo, 12,666.

**VENEZUELA, UNITED STATES OF.** A federal republic of northern South America. The capital is Caracas.

**AREA AND POPULATION.** The estimated area is 1,020,400 square kilometres (393,976 square miles), equivalent to about 13 per cent of the area of the United States. Pursuant to a convention signed at Bogotá, November 3, 1916, arbitration of the Colombian boundary has been entrusted to the president of the Swiss confederation. Estimated population, June 30, 1915, 2,816,484; June 30, 1916, 2,830,771. Caracas is supposed to have about 87,000 inhabitants; Valencia, 65,000; Maracaibo, 50,000; Barquisimeto, 35,000; Ciudad Bolívar, 22,000; San Cristóbal, 21,000; Mérida and Trujillo, each 15,000; Puerto Cabello, 14,000; La Guaira, 12,000.

**EDUCATION.** Elementary instruction is free and nominally compulsory, but illiteracy is

prevalent. Elementary schools, public and private, number about 1500, with about 50,000 pupils enrolled. There are over 100 secondary schools and a considerable number of institutions for more advanced and professional instruction.

**PRODUCTION.** The leading crops commercially are coffee and cacao. Other crops of importance are corn, sugar cane, cotton, beans, peas, potatoes, and tobacco. The cotton output is consumed almost wholly in the mills of Valencia, Caracas, and Cumaná. The crops of 1915-16 were poor, but those of 1916-17, notably coffee and cacao, were among the best on record. Sugar production has been increasing rapidly; the sugar export to the United States was about 318,300 pounds in 1914, 3,043,800 pounds in 1915, and 17,276,500 pounds in 1916. Forest products include balata, rubber, chicle, tonka beans, dividivi, copaiba, vanilla, and mangrove bark. Balata production shows a decline, due to the destructive methods of gathering; balata seems destined to disappear as an important article of export. The principal minerals exploited are gold, asphalt, copper, iron, and petroleum.

**COMMERCE.** Imports and exports in 1916 were valued at 106,914,089 and 117,652,851 bolivars respectively, as compared with 69,793,970 and 121,266,459 in 1915. The large import increase in 1916 was due to higher prices rather than to any considerable increase in the volume of trade. Imports and exports have been as follows, in thousands of dollars:

	1911	1912	1913	1914	1915	1916
Imports.	18,395	20,569	18,030	13,987	13,470	20,634
Exports.	22,684	25,261	29,484	21,521	23,404	22,707

Leading imports of merchandise in 1915 and 1916 were valued as follows, in thousands of dollars: cotton cloth, 2369 and 4172; wheat flour, 1102 and 1201; drugs, medicines, and chemicals, 630 and 738; machines and machinery, 569 and 658; woolen goods, 143 and 301; cotton knit goods, 174 and 405; automobiles, 244 and 406; lard, 288 and 355; stearin, 350 and 254; leather, 220 and 320; bagging, 228 and 467; cotton (and linen) thread and yarn, 298 and 577.

The table below shows principal exports, in metric tons and thousands of bolivars:

	Metric Tons		1,000 Bolivars	
	1915	1916	1915	1916
Coffee .....	62,581	50,814	60,869	54,676
Cacao .....	18,281	15,183	25,077	22,043
Gold .....	...	...	6,786	9,278
Hides .....	3,467	3,297	8,536	8,706
Skins .....	940	1,162	1,704	3,203
Sugar .....	4,205	9,273	1,188	3,462
Balata .....	1,027	626	4,090	2,937
Copper ore .....	8,838	11,779	1,094	1,745
Frozen meat .....	3,571	3,313	1,402	1,670
Animals .....	...	...	1,417	1,516
Asphalt .....	25,369	44,621	1,704	1,422
Sole leather .....	165	510	573	904
Pearls .....	...	...	253	861
Rubber .....	140	140	728	729
Dividivi .....	5,668	7,758	474	684
Algrettes .....	...	...	862	530
Chicle .....	454	74	1,147	132

In 1916 the coffee export to the United States was 25,971 metric tons, valued at 27,364,224 bolivars; France, 11,381 tons, 13,517,369 bolivars; Spain, 6149 tons, 5,555,661 bolivars. The

cacao export to the United States in 1916 was 5305 tons, 8,477,333 bolivars; France, 4417 tons, 6,499,623 bolivars; Spain, 1849 tons, 2,869,662 bolivars. The following table shows trade by countries, in thousands of bolivars:

	Imports		Exports	
	1915	1916	1915	1916
United States .....	41,157	67,144	68,239	61,118
United Kingdom .....	14,235	23,117	3,224	2,787
Spain .....	8,376	5,996	5,596	10,429
France .....	3,391	5,145	15,430	22,418
Italy .....	2,512	2,175	2,713	2,419
Netherlands .....	4,071	1,299	10,918	3,297
Trinidad .....	824	873	5,329	4,074
Curacao .....	14	139	5,663	8,759
Total, incl. others.	69,794	106,914	121,266	117,653

**COMMUNICATIONS.** A large amount of traffic is carried on by water; navigable rivers total some 11,000 miles. Railway in operation in 1916, 534 miles. In August, 1917, a concession was obtained by an American company for a line from deep water to the mining properties in the Goajira peninsula. The contracts involved the construction of a port at Castilletes and a line of American standard gauge 93 miles in length with branches 3 miles in length having a one-way capacity of 10,000 tons daily. Much attention has recently been devoted to the building of wagon roads. Expenditures for this purpose were 4,100,000 bolivars in 1916, as compared with 2,400,000 in 1915 and 1,000,000 in 1914. Telegraph line, 5455 miles, with 211 offices. Post offices, 296.

**FINANCE.** The legal standard of value is gold. The monetary unit is the bolivar, with 19.295 cents. For the year ended June 30, 1916, reported revenue and expenditure were 65,674,385 and 57,930,228 bolivars respectively. Revenue is derived largely from customs, taxes on cigarettes, matches, and liquor, and the salt monopoly. For the year 1917-18, the budget balanced at 44,120,000 bolivars. The estimated departmental disbursements included: treasury, 14,528,829 bolivars; war and marine, 9,802,821; interior, 9,340,026; public works, 3,181,400; fomento, 3,027,270; public instruction, 2,703,991. Public debt, December 31, 1915: foreign, 111,283,078 bolivars; internal, 50,147,493; total, 161,430,571; total debt, December 31, 1916, 154,527,857 bolivars.

**GOVERNMENT.** The legislative power is exercised by a congress of two houses, the Senate and the Chamber of Deputies. Senators (40 in number, that is, two for each state) are elected by the state legislatures for three years. Deputies, apportioned according to population, are elected by direct vote for three years. The executive power is vested in a president (assisted by a cabinet), who is elected by the congress for seven years and is eligible for reelection. Provisional president in 1917, Victorino Márquez Bustillos. He was elected, April 19, 1914, to succeed Gen. Juan Vicente Gómez, who had been president since 1909 and who now became commander-in-chief of the army. Gen. Gómez was elected president May 3, 1915, but retained his post as commander-in-chief, while Márquez Bustillos continued as provisional president.

**VERDUN.** See WAR OF THE NATIONS.

**VERMONT.** POPULATION. The population of the State in 1910 was 355,956, and on July 1, 1917, it was estimated to be 364,946.

**AGRICULTURE.** The acreage, production, and

value of the principal crops as estimated by the Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. Bu.	Value
Hay .....	1917	945,000	1,531,000	\$17,606,000
	1916	980,000	1,666,000	20,992,000
Wheat .....	1917	3,000	66,000	142,000
	1916	1,000	25,000	41,000
Oats .....	1917	88,000	3,168,000	2,693,000
	1916	80,000	2,460,000	1,664,000
Potatoes .....	1917	30,000	3,000,000	4,200,000
	1916	23,000	2,576,000	3,581,000
Corn .....	1917	54,000	2,538,000	5,406,000
	1916	45,000	1,935,000	2,128,000
Tobacco .....	1917	100	165,000	45,000
	1916	100	160,000	30,000

a Tons. b Pounds.

**TRANSPORTATION.** The total railway mileage of the State is about 1080. There has been practically no construction of roads during the last four years.

**FINANCE.** The State treasurer's report on June 30, 1917, showed the total receipts to be \$5,327,252. The cash on hand on July 1, 1916, was \$243,994, leaving a balance on June 30, 1917, of \$865,120.

**EDUCATION.** The total school population in the State in 1916, the latest year for which the figures are available, was 75,977. The total enrollment in 1917 was 63,962, with an average daily attendance of 49,604. There were 221 male teachers and 2991 female teachers. The average monthly salary of teachers was \$41.30. The total expenditure for school purposes was \$2,439,146.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the State Penitentiary at Windsor, the House of Corrections at Rutland, the Industrial School at Vergennes, the State Asylum for the Insane at Waterbury, the Soldiers' Home at Bennington, the State Sanatorium at Pittsford. There are also ten hospitals under the control of the State authorities. The State has no State board of charities.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below:

A heavier criminal punishment was placed upon the possession of military maps, plans, etc., or the furnishing of military information, or the injury of public property. The provision was made, however, that if the offense be committed under circumstances amounting to treason, the punishment shall be for this crime.

Penalties were imposed for the pollution or poisoning of the water supply of the State, and for injury to roads, bridges, public utilities, and other public property. The support of resident dependents of men who go into the national service was provided for. An accounting system in the administration of the State business was created. Permission was given the municipalities to adopt the city manager plan of government. Women taxpayers, over 21 years of age, were permitted to vote in the town meetings. An extraordinary prohibition act of 1915 was repealed. This measure was passed in 1915 for submission to the people by referendum; if approved it was to take effect in May, 1916, and if disapproved was nevertheless to take effect May 1, 1927. Amendments were made to the child labor laws. Acts were passed looking to the prevention of mo-

nopoly and unfair discrimination in the buying and selling of commodities—especially food products. The establishment of county tuberculosis hospitals was authorized.

**STATE OFFICERS:** Governor, Horace F. Graham; Lieutenant-Governor, Roger W. Hubbard; Secretary of State, Frederick G. Fleetwood; Treasurer, Walter F. Scott; Auditor, Benjamin Gates; Adjutant-General, Lee S. Tiltonson; Attorney-General, Herbert G. Barber; Commissioner of Education, Milo G. Hillegas; Commissioner of Agriculture, Elbert S. Brigham; Commissioner of Insurance, Jos. G. Brown.

**JUDICIARY.** Supreme Court: Chief Justice, John H. Watson; Associate Justices, William H. Taylor, Seneca Haselton, George M. Powers, Williard W. Miles; Clerk, L. C. Moody.

**VERMONT, UNIVERSITY OF.** A co-educational State institution at Burlington, Vt. In the fall of 1917 there were 600 students and 115 members of the faculty; about 150 students and 8 members of the faculty were in government service in 1917. The library contained 96,960 bound volumes and 37,000 pamphlets. Productive funds in 1917 amounted to \$951,048 and the income therefrom to \$36,121. Total income, except for Federal funds, amounted to \$213,281.55. The university maintained units of the R. O. T. C., and instruction was given to two schools of 175 and 200 each of enlisted men in the Signal Corps. The university was founded in 1791. President (absent on war service), Guy Potter Benton, LL.D.; acting president, George H. Perkins, Ph.D.

**VESICULAR STOMATITIS.** See VETERINARY MEDICINE.

**VETERINARY MEDICINE.** The veterinary profession proved its loyalty to the country by the patriotic spirit with which its members volunteered for war service. The difficult task of organizing the greater veterinary corps was successfully accomplished with the aid of leading members of the profession who were appointed as majors. Upon members of this corps dependence was placed first for the prevention of the purchase of unsound horses and mules for army service, particularly such as might be carriers of infectious diseases, and second the direct supervision of the health of all horses engaged in war service, of which in number there must be as many as one for every four soldiers.

Veterinarians were also busily engaged in the equally important work of increasing the production of foods through eliminating the loss of live stock from disease, an annual loss, as estimated by the secretary of agriculture in 1915, of not less than \$212,000,000. This work was carried on in a more intensive way than ever before with Texas fever, hog cholera, tuberculosis, dourine, scabies, etc. The efficiency of the veterinary service of the English army in the great war was shown in the reduction of the wastage of horses to less than 10 per cent a year, as compared with 55 per cent in the Boer War. That their valor was not lacking was evidenced by the military crosses that many have received.

**NECROLOGY.** The death of Dr. A. D. Melvin, who had been the chief of the Federal Bureau of Animal Industry since 1905, when he succeeded the late Dr. D. E. Salmon, occurred at Washington, D. C., on December 7. The inauguration and conduct of the cattle tick eradica-

tion work, more than one-half of which work he lived to see completed, stands as a monument to his administration. The vacancy caused by his death was filled by the appointment of Dr. John R. Mohler, formerly pathologist and assistant chief of the bureau. The development and extension of the work of the Bureau of Animal Industry led to a reorganization and the formation of the office of hog cholera control, office of serum-virus control, tick eradication division, and tuberculosis eradication division.

**ORGANIZATIONS.** The annual meeting of the American Veterinary Medical Association was held at Kansas City, Mo., August 20-23, with an attendance of 1500. The officers elected for the following year were: Dr. Frederick Torrance, veterinary director-general of Canada, president; Drs. John H. Blattenberg, C. M. Haring, H. Jensen, John S. Anderson, and S. H. Ward, vice-presidents; Dr. L. A. Merillat, secretary, and Dr. F. H. Schneider, treasurer.

**VETERINARY EDUCATION.** The existing regulations for applicants admitted to Civil Service examinations for veterinary inspectors in the U. S. Department of Agriculture were revised and after the fall of 1917 a fourth year of study with an increased number of hours was to be required. Such regulations were formulated and published by the secretary of agriculture and became effective on March 1. All the State veterinary colleges raised the entrance requirements to high school graduation. There was a decrease from the previous year by 51 per cent in the number of students entering veterinary colleges in the fall of 1916.

**VESICULAR STOMATITIS.** The event of perhaps the greatest consequence in the field of live stock sanitation was the appearance among horses and cattle of a disease known as vesicular stomatitis. This was of particular importance because of its spread among horses collected for military purposes and its close resemblance to foot-and-mouth disease, an extensive outbreak of which had just been stamped out (see YEAR BOOK, 1916). This outbreak was the most extensive that had occurred in the United States, it having been especially prevalent in Nebraska, South Dakota, Colorado, and Wyoming. From the remount station in the central west it became distributed by following the channels of trade from the western markets eastward as far as the Atlantic coast, and several shipments of infected horses were made to France where the disease was promptly detected.

**CATTLE TICK ERADICATION.** The year 1917 was a banner one in the history of tick eradication, an area of 20,000 square miles more than in any previous year having been freed from ticks. As a result of the work, the whole State of Mississippi was tick-free at the end of the year, all that remained under quarantine having been released on December 1 as part of the 65,520 square miles of territory set free in nine States. During the year 70,754 square miles were released, making a total of 379,312 square miles since the eradication work was commenced in 1906, leaving but 349,253 square miles, or about 40,000 less than half, to be cleared. Arkansas and Louisiana, following the lead of Mississippi, passed State laws which shortly would make tick eradication compulsory in every one of their infested counties, and the

legislature of Texas recognized the importance of tick eradication, though its law would not become effective for some time to come. It was estimated that in the 16 Alabama counties which eradicated the cattle tick in 1916, the value of cattle was increased \$10 per head, and that for every dollar expended by the county \$24 was realized. Congress appropriated \$631,560 for conducting the work during the fiscal year 1917-18. Plans for eradicating the cattle tick in Australia and in Argentina were submitted by commissions appointed for the purpose.

**DOUBINE.** Eradication work carried on with this disease during the year ended June 30 under an appropriation of \$75,000 resulted in its completion in Iowa and Nebraska. The work was nearing completion in North Dakota and Wyoming but considerable areas of infection still remained in Montana, South Dakota, Arizona, and New Mexico. The percentage of reaction in animals tested was 2.47, as compared with 3.1 for the preceding years.

**SHEEP SCAB.** Marked progress was made in the eradication of sheep scabies. Systematic work in Texas, commenced May 1, resulted in the release from quarantine on October 15 of 107 counties representing an aggregate area of 121,451 square miles or nearly one-half the State. During the fiscal year 9702 square miles in Colorado were released from quarantine as a result of eradication work. Outbreaks in Montana and Nevada, where the disease had not existed for several years, were traced to shipments into these States and were rapidly being brought under control.

**HOG CHOLERA.** Under the appropriation of \$360,000 for the fiscal year ended June 30, 1917, intensive work for the control of hog cholera was conducted in cooperation with State officials in 295 counties in 14 States. Actual statistics taken in experimental counties and careful estimates made in adjacent counties showed that in one group of 3 counties, where the control work had been under way 4 years, the percentage of loss from hog cholera had been held down constantly to from one-fourth to two-fifths of that in the 15 surrounding counties. In another group of experimental counties the average percentage of loss as compared with that in 18 surrounding counties was reduced from approximately nine-tenths in 1913 to less than one-third in 1914 and to about one-sixteenth in 1915. A total of \$413,100 was appropriated for investigation and control work with hog cholera during the year commencing July 1, 1917.

**TUBERCULOSIS.** Appropriations amounting to \$300,000 were made by Congress for use in inaugurating control work against this insidious disease of cattle, hogs, and poultry, which is annually responsible for the loss of live stock valued at no less than \$25,000,000. As a result of the eradication work commenced in the District of Columbia in November, 1909, only 0.84 per cent of the animals reacted in 1917 to the tuberculin test, as compared with 18.87 per cent in the first year of the work. In co-operative work with the Virginia farmers and officials the Federal Bureau of Animal Industry found but 6.3 per cent of the animals tested to be tuberculous, against 18.27 per cent in 1910. Offices were opened at several points in the country and co-operative work commenced with

a view to eradicating the disease from pure-bred herds and the establishment of accredited herds.

**ABORTION DISEASE.** Eichhorn and Potter reported that in a large herd where they had conducted investigations abortions were frequent while new cows were being purchased and susceptible material thus added, but as the practice was discontinued and the calves born in the herd were raised the disease progressively decreased, until at the present time abortion is rare and a definite herd immunity seems to have been established.

**BACILLARY WHITE DIARRHEA OF CHICKS.** In searching for an accurate method of detecting the presence of *Bacterium pullorum* that is simpler and cheaper than the agglutination test, Ward and Gallagher found the intradermal test to give encouraging results.

**EPIZOOTIC LYMPHANGITIS.** Since the war this disease had been introduced into France with horses imported from northern Africa, and had become one of the most important diseases with which the army veterinarian had to deal. French investigators found excellent results to be obtained from the intravenous injection of arsenobenzol.

**BOTULISM AND FORAGE POISONING.** Investigations reported by Graham of the Kentucky Experiment Station showed that *Bacillus botulinus* was probably the cause of much of the loss among horses and mules resulting from forage poisoning. Investigations under way by the Federal Bureau of Animal Industry tended to support Graham's work. A report by Dickson indicated that *B. botulinus* was also a cause of limberneck in chickens.

**BIBLIOGRAPHY.** Among the new works published were the following: J. Albrechtson, trans. by H. Wehrlein, *The Sterility of Cows, Its Causes and Treatment* (Chicago); F. T. Barton, *Diseases of the Dog* (New York); C. F. Bolduan and J. Koopman, *Immune sera* (5th ed., rev., New York); W. C. Bosanquet and J. W. H. Eyre, *Serums, Vaccines, and Toxins in Treatment and Diagnosis* (3rd ed., New York, 1916); A. Carrel and G. Dehelly, trans. by H. Child, *The Treatment of Infected Wounds* (London); J. Clark, *Shoeing and Balancing the Light Harness Horse* (Buffalo, N. Y., 1916); J. F. De Vine, *Bovine Tuberculosis* (Chicago); B. F. Kaupp, *Poultry Diseases* (2nd ed., rev. and enl., Chicago); H. C. Long, *Plants Poisonous to Live Stock* (Cambridge, Eng.); L. A. Merillat, *Fistula and Poll-Evil* (Chicago); H. Miesner, trans. by A. A. Leibold, *Epizootics and Their Control During War* (Chicago); C. Porcher and P. Godard, *Le Lait et la Fièvre Méditerranéenne* (Paris, 1916); M. R. Steffen, *Special Equine Therapy* (Chicago); E. R. Stitt, *Practical Bacteriology, Blood Work, and Animal Parasitology* (4th ed., rev. and enl., Philadelphia, 1916); K. and S. Von Ruck, *Studies in Immunization Against Tuberculosis* (New York, 1916); D. S. White, *A Text-book of the Principles and Practice of Veterinary Medicine* (Philadelphia); W. L. Williams, *Veterinary Obstetrics* (Ithaca, N. Y.); K. Winslow, *Veterinary Materia Medica and Therapeutics* (7th ed., rev., New York, 1916); *Special Report on Diseases of the Horse and Special Report on Diseases of Cattle* (U. S. Dept. Agr., Bur. Anim. Industry, rev. eds., 1916); *The National Formulary* (4th ed., Philadelphia, 1916); *New and Nonofficial Remedies, 1916* (Chicago, 1916).

**VICTORIA.** A State of the Commonwealth of Australia. It lies in the southeastern part of the continent, south of New South Wales and east of South Australia. After Tasmania, Victoria is the smallest of the Australian States; its estimated area is 87,884 square miles, which is about 3 per cent of the area of the Commonwealth and is somewhat larger than Pennsylvania and Ohio combined. Estimated population, June 30, 1916, 1,405,977, as compared with 1,430,667 at the end of 1914 and 1,315,551 at the 1911 census. These figures are exclusive of full-blooded aboriginals. The capital of Victoria is Melbourne, which is also the temporary capital of the Commonwealth; its population, including suburbs, was 684,000 at the end of 1915, as compared with 588,971 at the 1911 census. Estimated population of Ballarat at the end of 1915, 42,252; Bendigo, 37,660; Geelong, 35,285.

The legislative power is exercised by a parliament of two houses, the Legislative Council and the Legislative Assembly. The council consists of 34 members, elected for six years; the Assembly, 65 members, elected for the duration of parliament, which is limited to three years. Woman suffrage was adopted by an act of 1908. The governor in 1917 was Sir Arthur Lyulph Stanley, K. C. M. G., who was appointed in January, 1914. Premier, treasurer, and minister of labor, Sir Alexander James Peacock, K. C. M. G. See AUSTRALIA.

**VICTORY LOAN.** See CANADA.

**VILJOEN, BENJAMIN JOHANNIS.** A Boer general, died at La Mesa, N. M., January 14, 1917. He was born at Woodhouse, Eastern Cape Colony, in 1868. At 18 he went with the gold rush to the Rand, and in 1893, after three years in the employ of the Boer government, began to organize the Boer military forces, in which he became major. His capture of Dr. Jameson in 1896 broke up the Jameson raid and brought Viljoen the post of commandant of militia and special commandant of burghers around Johannesburg. During the Boer War his manner of fighting earned him the nickname of "the firebrand." He was so irreconcilable in his attitude toward the British that at last he was exiled to St. Helena. But in 1902 he was paroled, and after a visit to South Africa removed to the United States and established a colony of Boers in New Mexico. During the revolution in Mexico led by Madero he acted as military adviser to that general. He wrote: *Under the Vierleur*; *My Reminiscences of the Anglo-Boer War*; and *An Exiled General*.

**VILMORIN, PHILIPPE LE VEQUE, DE.** Head of the world-renowned French seed house, Vilmorin-Andrieux and Company, and one of the most conspicuous figures in European genetics. He was 45 years old and died on June 30, 1917. Plant breeding experiments and dog breeding tests had been carried on by M. Vilmorin for many years, and on one of his visits to this country he reported to the French government on the agricultural exhibits at the St. Louis Exposition. He organized the Fourth International Conference on Genetics, held in Paris, in 1911. He published his notes on observations on wheat; his experiments with American beet sugar; the culture of ginseng in Korea and Manchuria; and the tobaccos of commerce.

**VIRGINIA.** POPULATION. The population of

the State in 1910 was 2,061,612, and on July 1, 1917, it was estimated to be 2,218,025.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. Bu.	Value
Corn ... 1917	2,540,000	73,275,000	\$110,581,000
1916	2,100,000	58,800,000	54,684,000
Wheat . 1917	1,280,000	17,920,000	38,707,000
1916	1,200,000	15,240,000	25,146,000
Oats ... 1917	225,000	5,512,000	4,630,000
1916	250,000	2,875,000	3,701,000
Potatoes. 1917	200,000	19,800,000	24,750,000
1916	130,000	16,900,000	23,153,000
Hay ... 1917	850,000	a 986,000	21,002,000
1916	900,000	1,215,000	18,225,000
Tobacco. 1917	185,000	b 129,500,000	34,318,000
1916	190,000	129,200,000	18,843,000
Cotton . 1917	45,000	c 16,000	2,224,000
1916	42,000	27,000	2,631,000

a Tons. b Pounds. c Bales of 500 pounds gross weight.

**MINERAL PRODUCTION.** The output of coal in the State in 1916 was 9,707,474 net tons, an increase compared with 1915 of 1,584,878 tons, or 19.5 per cent in quantity, and of \$2,298,490 or 29 per cent in value. The quantity of coal made into coke increased more than 967,000 tons, and shipments increased 565,406 tons. The demand for coal and coke from Virginia fields was strong throughout the year. In the last six months the demand was considerably in excess of the supply. There was a scarcity of labor practically throughout the year, and the supply of cars was inadequate from June to the end of the year. The production of coal in the State in 1915 was 8,122,596 short tons, valued at \$7,962,934. The number of men employed increased from 8959 in 1915 to 9777 in 1916.

The production of iron in the State in 1916 was 440,492 gross tons, compared with 348,042 in 1915. The ore shipped from the mines in 1916 was 486,798 tons, valued at \$1,000,118 compared with 334,424 tons, valued at \$696,920 in 1915.

Virginia is the leading State in the production of iron pyrites. The production was 148,502 long tons in 1916, valued at \$925,243.

**FINANCE.** The report of the State treasurer for the fiscal year 1917 showed a balance in the treasury on September 30, 1916, of \$356,962. The total receipts for the fiscal year amounted to \$9,208,127, and the expenditures to \$9,094,126, leaving a balance on hand on September 30, 1917, of \$297,256.

**EDUCATION.** The total school population in 1915, the latest census available, was 658,926. The total enrollment in the public schools in 1917 was 495,424, with the average daily attendance of 335,744. There were 2084 male teachers, and 11,622 female teachers. The average monthly salary of teachers was \$49.14.

The total expenditure for school purposes was during the year, \$8,812,118.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the State Penitentiary at Richmond, the State Farm at Lassister Post Office, the Central State Hospital at Petersburg, Southwestern State Hospital at Marion, the Western State Hospital at Staunton, the Virginia State Epileptic Colony and the Virginia Colony for the Feeble-Minded at Madison Heights, the Catawba Sanatorium, the Vir-

ginia School for the Deaf and Blind at Catwaba, and the Virginia State School for the Colored Deaf and Blind at Newport News.

**STATE OFFICERS.** Governor, Westmoreland Davis; Lieutenant-Governor, B. F. Buchanan; Secretary of Commonwealth, B. O. James; Auditor, C. Lee Moore; Treasurer, G. H. Urner; Superintendent of Instruction, Harris Hart; Attorney-General, Hugh A. White; Adjutant-General, W. W. Sale; Commissioner of Agriculture, George W. Koiner; Commissioner of Insurance, Joseph Button—all Democrats.

**JUDICIARY.** Supreme Court of Appeals: Justices, S. G. Whittle, Joseph L. Kelly, Frederick W. Sims, Robert R. Prentiss, Martin P. Burks; Clerk, H. Stewart Jones.

**VIRGINIA, UNIVERSITY OF.** A State institution for the education of men at Charlottesville, Va. (post office: University, Va.). In the fall of 1917 there were 752 students and 68 members of the faculty. The library contained about 90,000 volumes. Productive funds in 1917 amounted to \$2,471,545 and the income therefrom to \$100,939. An anonymous gift of \$250,000 was announced in 1917. The university was founded in 1819. President, Edwin A. Alderman, LL.D.

**VIRGIN ISLANDS.** Several small islands lying to the eastward of Porto Rico. A group of these constitutes the presidency of the Virgin Islands, which is a part of the British colony of the Leeward Islands (q.v.). The other islands are American: St. Thomas, St. Croix, St. John, Vieques, and Culebra. St. Thomas, St. Croix, and St. John were formerly the Danish West Indies and were sold by Denmark to the United States in 1917 for \$25,000,000; their combined area is 139 square miles, and their population, which is mostly negro, was returned as 27,086 by the 1911 census. On February 20, the United States Senate passed the bill for their purchase. The measure also provided for an investigation of the needs of the people by a committee of three. Until a final form of government has been established, the present laws and officials were continued. The president, however, is given power to appoint a governor and many minor officials. On March 3 the president approved a governing act for these islands.

**VITAL STATISTICS.** According to statistics recently compiled by the Metropolitan Life Insurance Co., the accident rate for the working class for the United States increased during 1916 by five per hundred thousand over that of 1915. The increase was thought to be a result of the increased activity in industry and partially due to the speeding-up processes incident to the demands of war.

A large number of deaths is caused annually in India by wild animals. During the year ending June 30, 1916, 26,385 persons died in India from snake bite, an increase of 3700 over the previous year. Over 2000 more deaths were caused by elephants, tigers, and other animals. During the past five years, elephants, tigers, and other animals have killed 9192 people in British India, and of these tigers have claimed a total of 3682. In the same period, 116,828 persons have died as the result of snake bites. In the United Provinces, one man-eating tiger in the Almora district killed ten persons out of the provincial total of twenty. In order to effect the destruction of as many wild animals and

snakes as possible, the government pays bounties. The number of animals destroyed in 1915 was 25,036, including 1582 tigers, 6623 leopards, 2775 bears, and 2191 wolves. The total number of snakes killed was 184,663.

In an analysis of the figures shown in the new United States life tables based on the United States Census of 1910 and the mortality statistics for 1909, 1910, and 1911 in the original registration states, J. W. Glover (*Public Health Reports*, January 5, 1917) says that the excess of city over rural mortality should receive the attention of health authorities to determine its cause and to what extent it may be reduced. Out of 100,000 births of males in the country, 58,117 survive to the age of 60, while among the same number of city births only 43,454 survive to that age. Glover says these figures are so astounding that they deserve the utmost prominence. Recent life tables, it is said, show similar differences in England and Germany. The tables also show that the mortality rates among women are lower throughout the entire range of life than for men and that the expectation of life is much greater. A striking exception is in the case of women in rural communities. Between the ages of 20 and 40, the mortality rate for rural women is almost as great as that for men, except from 25 to 31, in which period it is actually greater. The same is true for negro women from the ages of 10 to 20.

Vital statistics of countries engaged in the greatest of all wars are of special interest. The quarterly returns of the British registrar-general for the three months ending with September have just been issued. The birth rate has shown a slight rise. It is now 21.7 per thousand of the population, as compared with 19.5, the rate in the fourth quarter of 1915, which was described as the lowest birth rate recorded in any quarter since the establishment of civil registration. The deaths registered amounted to 102,457 civilian and non-civilian. This is a rate per thousand of 11.2. Infant mortality, measured by the proportion of deaths under 1 year to registered births, was equal to 79 per thousand, being 41 per thousand below the average in the ten preceding third quarters, and equal to the lowest recorded quarterly rate, namely, that for September quarter, 1912.

In Germany in 1911 the death rate per thousand population was 16.3; in 1912, it was 14.6; in 1913, 14.0; in 1914, 16.1; in 1915, 19.7, and during the first six months of 1916 (computed by the year), 17.0. The increase occurred only in cities of 15,000 population and over, including all persons in the military service, especially the wounded. The mortality for 1916 was only 0.7 per cent greater than in 1911, certainly not a remarkable increase. The infant mortality during the first year of life was: 1911, 29.7 per cent; 1912, 24.6 per cent; 1913, 24.8 per cent; 1914, 22.7 per cent; 1915, 13.4 per cent; 1916 (first half of the year), 11.5 per cent. In other words, a continuous and steady reduction, even during the period of food restriction.

The annual report of the New York Health Department for the year 1916 shows that, despite the epidemic of poliomyelitis during the summer, the death rate was the lowest the city has ever recorded, namely, 13.89 deaths per thousand population. Among the most notable

achievements to which the report calls attention was the reduction of the infant mortality rate. In 1910, out of every thousand infants born, 125 died during the first year of life; in 1915 the rate was ninety-eight. The birth records show a decrease of 3592 over the number for the preceding year. The reasons ascribed for this are the decrease in foreign immigration and the low marriage rate experienced during the previous year, this being probably due to financial depression, non-employment, etc. The year 1916 witnessed an increase in the number of deaths from violence, 4235 deaths from this cause occurring in 1916 as compared with 3819 deaths in 1915. The report states that the majority of these deaths were avoidable.

**VIVIANI, RENÉ.** See UNITED STATES AND THE WAR.

**VIX, GENEVIÈVE.** See MUSIC, *Opera*.

**VOCATIONAL EDUCATION.** See EDUCATION IN THE UNITED STATES.

**VOLCANOES.** An outburst of Quetzaltepeque or San Salvador volcano occurred on June 7, 1917, and wrought widespread damage upon the towns and cultivations of the region. The display was preceded by heavy earthquakes which destroyed most of the buildings in the city of San Salvador southeast of the mountain, but which seem to have been rather localized. The eruption was attended by loud detonations as the gases made their way to the surface and by the emission of lava and incandescent ash in large volume. The lava and mud flows reached down the slopes far enough to engulf the towns of Nejapa, Quetzaltepeque, and Armenia, while the ash was borne by the west wind over the crest of the mountain as far as Zaragoza, laying waste the extensive sugar and coffee plantations within the area. It appeared that no further damage resulted to the city of San Salvador than was accomplished by the earthquake, but the work of the latter had been sufficiently complete. The loss of life must have been considerable, but was not enumerated in the preliminary accounts.

Note has been made previously in the YEAR BOOK of the studies emanating from the Hawaiian Volcano Observatory. The results of its investigations appear from time to time in the scientific periodicals of this country. In one of the later articles T. A. Jaggar gives an account of the Mauna Loa outbreak of May, 1916, which he attributed mainly to the accumulation of gas pressure in the conduit. The agency of gas is made the prominent factor in the activity of both Kilauea and Mauna Loa, which he considered to be connected through subterranean gas channels rather than lava siphons. The eruption was accompanied in both its early and late stages by the outflow of highly vesicular lava and of quantities of fumes. Water vapor seems to be a minor feature of the process. H. S. Washington gave an account of the Stromboli eruptive channels which he found to possess a high degree of persistence, the same vents having been in use for over 150 years. This characteristic was not peculiar to Stromboli, but applies to Kilauea and other volcanoes as well. It is interpreted as confirmatory of the gas-fluxing hypothesis developed by Daly. See ALASKA.

**VOLHYNIA.** A government of West Russia, lying east of Poland and Galicia. The area is stated at 27,699 square miles, which is a little

larger than the combined land area of New Hampshire, Vermont, Massachusetts, and Rhode Island. Population, 4,241,800, according to the estimate of January 1, 1915. More than three-fourths of the people are Little Russians, the elements of the population being White and Great Russians, Poles, Jews, and Germans. Many Germans live on lands bought from the Russian government. The conditions of peasant ownership of land are somewhat different from those obtaining in other parts of Russia, the peasants owning approximately one-half. Over half of northern Volhynia is under forest. There is considerable agricultural activity in the southern part, which is said to be capable of producing approximately 80,000,000 bushels of cereals. The capital of Volhynia is Zhitomir, which, before the great war, had an estimated population of 96,800.

**VOLHYNIC FEVER.** Sachs reports nine cases of this disease, often called "Five-day Fever," but deprecates both terms as not being descriptive. The disease is not confined to Volhynia, nor does it follow a five-day course. He suggests the term tibialgic fever or neuralgic fever. Topfer incriminates the louse in the transmission of the disease. He found a thick short bacillus in specimens that had bitten patients and believes the disease is similar to, but not identical with, typhus.

**VOLUNTEERS OF AMERICA, THE.** A Christian social and philanthropic organization inaugurated in 1896 in response to requests by American citizens. It was subsequently incorporated in November, 1896, under the laws of the State of New York, is modeled after the United States army, but nevertheless possesses a thoroughly democratic form of government. Its constitution and by-laws were framed by a grand field council, which represents the minor councils of officers throughout the country annually. In 1917 the volunteers had 56 homes and benevolent institutions in the United States. The volunteer workers in the same year visited 25,549 families, gave 522,067 lodgings in their charitable institutions, and 820,072 full meals, while 1,230,175 meals were given to those who paid for them by work. The Volunteer Prison League has embraced upward of some 75,000 members since its inauguration; it has leagues in nearly thirty-seven States prisons, and over 72 per cent of those who have left the prisons are living reformed and honest lives through the aid of the Volunteer Hope Halla. In the latest undertaking, the Volunteer Hospital in New York City, in 1917 there were 1418 ambulance calls, 430 major operations, 11,713 day treatments given to patients in the medical and surgical wards, 9435 new cases treated in the dispensary, and a total treated in the hospital during the year of 38,358 cases of all kinds, surgically and medically. Besides these, 1311 cases were treated in homes by the hospital's physicians. The Fresh Air Branch of the work takes many thousands of mothers and little children away from the crowded cities in the hot season. In 1917 842,330 persons were gathered in the Volunteers' indoor services, while 2,118,196 attended the 8895 open-air services. By these services 8743 persons were led to promise that they would lead a new life. In addition to Volunteer Reading Rooms, thousands of copies of Christian literature are circulated in the State prisons, jails, soldiers'

homes, hospitals, and children's homes. There are also sewing classes, hospital nursing, temporary financial relief departments, fresh-air camps, Thanksgiving and Christmas dinners. The headquarters of the Volunteers is at 34 West 28th Street, New York City. The principal officers in 1917 were: Presidents, General and Mrs. Ballington Booth; vice-president, General Edward Fielding; treasurer, Col. Walter Crafts; national secretary, Col. James Merrill.

**VON BERNSTORFF, COUNT.** See UNITED STATES AND THE WAR.

**VORARLBERG.** An Austrian crownland. Area, 1005 square miles. Population (1910 census), 145,408. Austrian subjects, 132,008; of these, German was the vernacular of 126,723 (95.36 per cent); Italian or Ladin, 5857 (4.41). Catholics formed 98.48 per cent of the population. Capital, Bregenz, on the Lake of Constance. The crownland has a diet of 26 members and is represented by 4 members in the Austrian Reichsrath.

**WAGES.** See LABOR; MINIMUM WAGE; UNEMPLOYMENT.

**WAGNER, ADOLPH.** A German economist, died in Berlin, November 9, 1917. He was born at Erlangen, Bavaria, in 1835. After studying jurisprudence and political science at Göttingen and Heidelberg he was professor successively in the Commercial Academy at Vienna, and at Dorpat, Freiburg (from 1870), and Berlin universities. He was appointed a member of the Royal Statistical Bureau of Prussia and he was a member of the Prussian Lower House in 1882-85. Wagner was one of the founders of the Verein für Socialpolitik. His doctor's dissertation was a monograph on the science of banking (*Beiträge zur Lehre von den Banken*, 1857). His series of notable works on banking, taxation, and social reform was begun in 1862; but his first publication in economics proper was a revision of Rau's *Lehrbuch der politischen Oekonomie* (1875-76). In later editions the work underwent so many changes that it bore no direct relation to Rau's original work, and it was published under the title *Lehr- und Handbuch der politischen Oekonomie*, of which the *Grundlegung* was Wagner's own work (1892-94), as well as the *Finanzwissenschaft* (in four parts, 1877-1901). The *Grundlegung* and the *Finanzwissenschaft* are his best known and most important works. Besides these he wrote many books and articles on social science and practical economic problems. Wagner approached economics from the point of view of jurisprudence and statistics. In the main he followed the inductive method, although in his *Grundlegung* he tends toward the deductive methods of the theoretical branch of economics. Although sometimes classed as an economist of the historical school he rejected the view that historical and inductive studies make up the whole of fruitful economic science. In his financial work he favored the extension of state functions, which often caused him to be regarded as a Socialist. He admits, however, the defects of the pure Socialistic theory and seeks to establish the proper limits of Socialism and individualism. He resigned his chair in the University of Berlin in January, 1916. Emperor William conferred upon him the order of the Red Eagle, and he was made a life member of the Prussian House of Lords in 1910.

**WALES.** A division of the United Kingdom, situated west of middle England, with the Irish Sea on the north and Bristol Channel on the south. The area is 7466 square miles, which is a little smaller than the land area of New Jersey. Population (1911 census), 2,025,202. See GREAT BRITAIN.

**WALKER, WILLIAM DAVID.** An American Protestant Episcopal bishop. He was born in New York City on June 29, 1839, and died on May 2, 1917. He graduated from Columbia in 1859 and from the General Theological Seminary in 1862. From 1883 to 1896 he was missionary bishop of North Dakota. In the latter year he was appointed bishop of western New York. In 1887 he was appointed by President Cleveland a member of the United States Board of Indian Commissioners. In 1900 Theodore Roosevelt appointed him a member to the special commission for investigating conditions among the Indians of New York State. While in the west he originated the cathedral car, by means of which it was possible to conduct church services at places that otherwise could not be reached. He served as select preacher to the University of Cambridge and received honorary degrees from Oxford, Columbia, and other universities. He wrote: *Reports to the President and Congress on the Sioux and Chipewewa Tribes of Indians in North Dakota; Regulations of Wealth to Labor; God's Providence in Life.*

**WALLACHIA.** A former principality, now the central and western division of Rumania. It is bounded on the north by Transylvania and Moldavia, touches Hungary proper on the west, and by the Danube is separated on the west from Serbia, on the south from Bulgaria, and on the east from the Dobruja. The area is stated at 29,916 square miles, which is about equal to the land area of the State of Maine. Population, 4,712,291, according to the census of January 1, 1913. Wallachia consists of Great Wallachia (Muntenia), with an area of 20,283 square miles and 3,298,394 inhabitants; and Little Wallachia (Oltenia), constituting the southwest portion of Rumania, with 9633 square miles and 1,413,897 inhabitants. The largest city is Bucharest (Bucureshti), which was the capital of Rumania until the government fled to Jassy, in Moldavia, upon the German invasion in 1916; Bucharest fell December 6 of that year. Its population prior to the great war is stated at 345,628 (308,987 on January 6, 1917); Braila had 65,911 inhabitants; Ploieshti, 57,376; Craiova, 51,877; Buzau, 29,483; Turnu-Severin, 23,801; Giurgevo (Giurgiu), 20,929.

##### I. THE WAR IN BRIEF

On June 28, 1914, the Austrian heir-apparent, Archduke Francis Ferdinand and his wife were assassinated at Sarajevo, the capital of Bosnia. Accusing Serbia of complicity in the crime and alleging that the anti-Austrian machinations of Serbian patriots menaced the integrity of the Hapsburg Empire, Austria-Hungary on July 23, 1914, delivered an ultimatum containing demands with which the Serbian government would only partially comply. Despite the diplomatic remonstrances of other powers, Austria-Hungary refused to submit the matter to peaceful arbitration and declared war on Serbia, July 28, 1914. The Russian government, frankly sympathetic with Serbia, ordered the mobilization of the Russian army and declined to countermand the order, whereupon the German government declared what it considered to be a defensive war against Russia, August 1, 1914. Two days later Germany declared war against Russia's ally, France. Preparatory to an invasion of France, German troops had already occupied Luxemburg, August 2, and begun to invade Belgium, August 4, notwithstanding Belgian opposition. The British Government construed the German violation of Belgian neutrality as a *casus belli* and declared war against Germany, August 4. Serbia and the "Allies,"

or Entente Powers—Russia, France, and Great Britain—were subsequently joined by Montenegro (August 7, 1914), Japan (August 23, 1914), Italy (May 23, 1915), Portugal (March 9, 1916), Rumania (August 27, 1916), United States (April 6, 1917), Panama and Cuba (April 7, 1917), Greece (July 2, 1917), Siam (July 21, 1917), Liberia (August 4, 1917), China (August 14, 1917), and Brazil (October 26, 1917). The "Teutonic" or Central Powers—Austria-Hungary and Germany, on the other hand, while they failed to receive the support of their former ally, Italy, succeeded in enlisting the aid of Turkey ("state of war" with Russia, October 30; attacked by Great Britain and France, November 5, 1914) and Bulgaria (October 14, 1915).

From the outset the Allied navies controlled the seas, putting an end to German overseas commerce and compelling the German battle-ships for the most part to remain in home waters under the protection of coast defenses and mines, although the main German battle fleet ventured out to fight an indecisive battle off Jutland, May 31, 1916, and swift German battle cruisers repeatedly raided the British coast. The naval engagements in the Bight of Heligoland (August 24, 1914), off Coronel (November 1, 1914), off the Falkland Islands (December 8, 1914), near Dogger Bank (January 24, 1915), and in the Gulf of Riga (October 1917) were of secondary importance. A few daring German commerce raiders and the surprisingly effective German submarines were able to inflict considerable damage upon the Allied and neutral merchant marines, but not to break the virtual blockade by means of which Great Britain hoped to starve out her principal enemy.

The military operations may be briefly summarized as follows: (1) In the Franco-Belgian theatre, the gallant defense of Liège (August 4-5, 1914), the stand at Mons-Namur-Charleroi (August 21-24, 1914), and a counter-invasion of Alsace-Lorraine (August, 1914) failed to stop the onward sweep of the German armies through Belgium, Luxemburg, and Lorraine toward Paris. The high tide of the German invasion was reached in the Battle of the Marne (September 6-10, 1914), after which the German right wing fell back upon the Aisne River and extended itself northward through Picardy, Artois, and Flanders to the Belgian coast. From October, 1914, to December, 1917, the long intrenched battle line from Flanders remained almost stationary, although terrific attempts to break through were made by the Germans in Flanders (October-November, 1914), again at Ypres (April-May, 1915), in the Argonne (July, 1915), and at Verdun (February-July, 1916); as well as by the Allies at Neuve Chapelle (March 10, 1915), in the region just north of Arras (May-June, 1915), in Champagne (September-October, 1915), in Arois near Lens (September-October, 1915), in the valley of the Somme, which resulted in the evacuation of 1600 square miles of French territory (July, 1916-March, 1917), near Arras (April-June, 1917), on the Aisne (April-November, 1917), in Flanders (July-December, 1917) and at Cambrai (November-December, 1917). (2) In the East the initial Russian offensive in East Prussia was shattered by Hindenburg at Tannenberg (August 26-31, 1914); an Austro-German coun-

ter-invasion of Russian Poland was checked before Warsaw (February, 1915); the Russian armies invading Austrian Galicia attained the passes of the Carpathians early in 1915, but were completely expelled from Austrian territory by "Mackensen's Drive" (May-June); and an Austro-German invasion of Russia under the masterly direction of Hindenburg, after conquering Warsaw (August 4, 1915), Brest-Litovsk (August 25), and Vilna (September 18, 1915) was halted only by the swamps before Riga, the lakes around Dvinsk, and the Pripet marshes. The Russians returning to the attack in 1916 (June-August) recaptured the Volhynian fortresses of Lutsk and Dubno, conquered the Bukovina, and penetrated up the Dniester River in Galicia as far as Halicz. The Russian revolution brought operation of the East Front to a standstill in 1917, the only outstanding features being the unsuccessful Russian offensive (July) and the fall of Riga (September-October). (3) After two important Austro-Hungarian attempts to "punish Serbia" had failed (in August and December, 1914), a new Austro-German invasion of Serbia was undertaken in October, 1915, with the aid of Bulgaria, and by December 5, 1915, Serbia was completely conquered. Anglo-French forces endeavoring to succor Serbia were defeated in the battle of the Vardar (December, 1915), and driven back on their base, Saloniki, in Greek territory. Montenegro and northern Albania were overrun by Austrian and Bulgarian armies (January-February, 1916); the summer of 1916, however, the Allied army of Saloniki assumed the offensive and wrested the Serbian town of Monastir from the Bulgarians (November 19), but were unable to advance very much beyond that point in 1917, owing to the complete downfall of Russia and Rumania.

(4) Rumania, entering the war on August 27, 1916, too rashly sent her armies to "emancipate" Transylvania, leaving the Dobruja undefended against Mackensen; the Rumanian invaders of Transylvania were thrown back by Falkenhayn; and all of Rumania, excepting a small part of Moldavia, was conquered by the Central Powers. Disclosures made by the Russian revolutionists show that Rumania was betrayed by the Germanophile Russian premier, Stürmer, who failed to send the promised army to protect Rumania's flank. (5) Turkish armies held the Dardanelles against Anglo-French attacks (February, 1915, to January 8, 1916); delivered futile attacks upon the Suez Canal; captured a British army under General Townshend in Mesopotamia (April 28, 1916); and expelled the Russians from Kermanshah (July 5, 1916) and Hamadan, (August 10, 1916), but were unable to defend the important Armenian cities of Erzerum (February 16, 1916), Trebizond (April 18), and Erzincan (July 25) against the Grand Duke Nicholas' advance. Assuming the offensive in 1917, the Allies took Kut-el-Amara (February 24), Bagdad (March 10), and Jerusalem (December 10). (6) The Italians, having painfully penetrated into the Trentino a few miles, were rudely repulsed in May, 1916; towards Trieste the Italians made slow progress and finally captured Gorizia, August 9, 1916. Striking out on the Carso and Bainsizza plateaus in the spring and summer of 1917, the Italians were making substantial progress towards Laibach and Trieste, when

they were again rudely repulsed by a German-Austro force and hurled back to the Piave River (October-December, 1917). (7) All of the German colonies were taken: Kiaochow (in China) by the Japanese (November 6, 1914); the German island possessions in the Pacific by British and Japanese expeditions; Togoland (August, 1914), Kamerun (February, 1916), German Southwest Africa (July, 1915), and German East Africa (December, 1917) by British, Portuguese, Boer, French, and Belgian forces.

Detailed accounts of the events here summarized will be found in the YEAR BOOKS for 1914, 1915, and 1916 under WAR OF THE NATIONS, as well as in the present article. See also the cross-references given at the end of this article.

## II. THE SITUATION ON JANUARY 1, 1917

At the close of the year 1916 the situation of the Entente Allies was far from encouraging. The military operations of the preceding twelve months showed a distinct balance in favor of the Teutonic Allies. The Russians, it is true, had shown remarkable powers of recuperation after the crushing defeat which they had sustained at the hands of the Germans under Mackensen and Hindenburg in 1915. Gen. Brusilov and Lechitsky began in June, 1916, a drive which lasted ten weeks and resulted in the reconquest of part of Galicia and Bukovina. In the west also the French had made an heroic and successful stand against the terrific German drive against Verdun, while the British had made substantial progress in the campaign on the Somme. The Italians, too, had made slow but steady progress in regaining the territory from which they had been driven earlier in the year by the Austrians. These Allied successes, however, were more than counterbalanced by the victories of the Teutonic Powers. Montenegro and northern Albania were occupied by the Austrians. Rumania, entering the war after two years of watchful waiting, was overwhelmed by the combined forces of the Germans, Austrians, Bulgarians, and Turks. In Mesopotamia the ill-fated British force under General Townshend had been forced to surrender. Despite these apparent advantages the problem which confronted the Teutonic Powers at the beginning of 1917 was a most serious one. Opposed to them was a group of nations possessing greater immediate and far greater ultimate resources. It was of the greatest importance for the Germans, if possible, to win a decision before these vast resources of the Entente Allies could be brought to their maximum strength. Already at the beginning of the year the British and French forces on the Western Front were sufficiently strong to make it practically impossible for the Germans to win a military decision in this region. There remained but one recourse for the Germans if they were to win a prompt success against their two chief enemies. This was the use of the submarine in the effort to starve England into submission. So important did this appear that the Germans were willing to risk the danger of bringing the United States into the war. They gambled on obtaining a decision by the submarine, even if the United States became a belligerent, basing their hopes upon their ability to force England to her knees

before the resources of the United States could become effective. Events proved that the Germans had miscalculated as badly in this instance as they had at the beginning of the war when they invaded Belgium in the hope of obtaining a quick and decisive victory in France.

### III. THE DIPLOMACY OF THE WAR

THE UNITED STATES ENTERS THE WAR. During the early part of the year 1917 the United States, through the president, continued its earnest efforts to bring about peace (see *Peace Proposals*). But it was evident that events were making it more and more difficult for the United States to maintain its position of neutrality. The activities of German submarines resulted in the sinking of a large number of vessels with Americans on board, some of them under circumstances which seemed to conflict with the promise made by Germany on May 5, 1916 (see UNITED STATES AND THE WAR in the NEW INTERNATIONAL YEAR BOOK for 1916). The German government attempted to justify these acts on various grounds. Some of the vessels were said to be transports, others to be sailing without lights and mistaken for warships. The irritation in the United States was increased by the activity of German agents in destroying munition factories and plotting to prevent the shipment of munitions to the Entente Allies. See UNITED STATES AND THE WAR.

The situation became acute when, on January 31, 1917, the German government declared its intention of pursuing unrestricted submarine warfare in a zone around enemy countries, and sinking, after February 1, 1917, all ships which were encountered in that zone. The notice stated that a prohibited zone had been mapped out by Germany, bordering Holland, England, and France and a portion of the Mediterranean Sea. An exception was made in favor of the United States under the following conditions: A "safety zone" consisting of a narrow lane leading to Falmouth, England, was designated, through which one American passenger vessel a week would be allowed to go, provided it carried no contraband. On February 3, the president made his historic address before a joint session of Congress declaring that he had determined to break off diplomatic relations with Germany. For the full text see UNITED STATES AND THE WAR.

The reality of the German threat soon became evident. On February 7 the British ship *California* with American passengers on board was sunk without warning and American lives were lost. A communication was received from Germany through the Swiss minister suggesting negotiations to arrange a modification of the submarine policy, but Secretary Lansing replied that no negotiations would be undertaken until Germany withdrew her blockade order. For several weeks matters remained in a most unsettled and unsatisfactory situation. There was a practical embargo of American shipping, owners refusing to send out vessels until armament was secured for them or convoys were supplied by the government. At the same time the submarine warfare continued unabated. Finally, on February 26 the president applied to Congress for authority to supply merchant vessels with defensive arms and "to employ any other

instrumentalities or methods that may be necessary and adequate to protect our ships and our people in their legitimate and peaceful pursuits on the seas" (for text see UNITED STATES AND THE WAR). Congress was unwilling to confer upon the president large discretionary powers. The lower house passed a bill authorizing the president to place defensive armament on merchant vessels and making an appropriation of \$100,000,000 for that purpose. It refused, however, to give him authority "to employ any other instrumentalities" to protect American ships. In the Senate the bill failed to pass, owing to a small but determined opposition, before the session of Congress ended on March 4. Aroused by the failure of Congress to meet the critical situation, the president issued a statement severely rebuking the "little group of willful men" in the Senate who had defeated the will of the overwhelming majority in both houses and he called upon the Senate to amend its rules so that such a situation could not happen again. Impressed by the wave of popular approval which greeted the president's stand, the Senate, which had been called in extra session on March 5, proceeded to amend its rules, so that a two-thirds vote of the Senators present could shut off debate and bring a measure to a vote. See UNITED STATES, Sixty-Fifth Congress.

The country was further aroused by the disclosure of German intrigues in Mexico. The German foreign secretary in a letter to the German minister in Mexico proposed an alliance between Germany and Mexico, in case the United States should enter the war, promising financial aid and the restoration of New Mexico, Texas, and Arizona to Mexico. Japan was also to be asked by Mexico to desert the Entente Allies and join the new alliance. See UNITED STATES AND THE WAR.

Under the circumstances the president determined to act without further legislative sanction. On March 12 he announced that armed guards would be placed on all American vessels passing through the barred zone. The continued sinking of American vessels hastened the crisis and on March 21 the president called Congress to meet in special session on April 2 "to receive a communication concerning grave matters of national policy." Before the joint session of Congress President Wilson read his remarkable war message. He reviewed the accumulated grievances of the United States against the German government, and the forbearance which we had shown under great provocation. He then stated that matters had now reached such a pass that he felt compelled to "advise that the Congress declare the recent course of the Imperial German government to be in fact nothing less than war against the government and people of the United States." The president further stated that the great war had become a struggle between the two antagonistic principles of autocracy and democracy and that the "world must be made safe for democracy." He proclaimed that "we have no selfish ends to serve. We desire no conquest, no dominion. We seek no indemnities for ourselves, no material compensation for the sacrifices we shall freely make." He asserted that "our object is to vindicate the principles of peace and justice in the life of the world as against selfish and autocratic power, and to set

up among the really free and self-governed peoples of the world such a concert of purpose and of action as will henceforth ensure the observance of those principles." He insisted that we had no quarrel with the German people and that we "shall desire nothing so much as the early reestablishment of intimate relations" with them as soon as they have repudiated their present irresponsible government. For the full text of the note see UNITED STATES AND THE WAR.

The president's address was received with the greatest enthusiasm by Congress. A joint resolution was introduced into both Houses declaring that a state of war had been thrust upon the United States by Germany. The resolution passed the Senate on April 4 by a vote of 82 to 6. The six negative votes were cast by Senators La Follette, Gronna, and Norris, Republicans, and Stone, Lane, and Vardaman, Democrats. In the House of Representatives, after a debate which lasted from 10 A. M. on April 5 to 3 A. M. April 6, the resolution passed by a vote of 373 to 50, nine not voting. The affirmative included 193 Democrats, 177 Republicans, 3 Independents; the negative included 16 Democrats, 32 Republicans, 1 Socialist, and 1 Independent. The president issued the proclamation declaring a state of war with Germany on April 6.

The entrance of the United States into the war created a profound sensation throughout the world. It aroused the greatest enthusiasm among the Entente Allies. Premier Lloyd George declared that "America had at one bound become a world power in a sense she had never been before." He praised the "courage and chivalry" which brought the American people to the defense of human rights. President Poincaré of France stated that "the great American republic" had proven faithful to its ideals and its traditions. Mr. Asquith, speaking before the House of Commons, said, "I do not use language of flattery or exaggeration when I say it is one of the most disinterested acts in history."

In this country there was neither tumult nor hysteria; everywhere there was a calm but earnest spirit of loyalty. The apprehension felt by some that there might be serious disturbances among the large number of citizens and aliens of Teutonic blood, proved to be unfounded.

The Austrian government on April 8 and the Turkish government on April 20 severed diplomatic relations with the United States.

The entrance of the United States into the war did not signify the adhesion of this country to the Entente Alliance. The traditional feeling against alliances with European powers which had always been a cardinal principle of American foreign policy was still very strong. There was also a feeling that the United States should maintain a free hand and not be bound by the various territorial agreements that had been made by the Entente Powers.

**DECLARATION OF WAR AGAINST AUSTRIA-HUNGARY.** As stated above Austria-Hungary severed diplomatic relations with the United States two days after the United States declared war on Germany. During the summer and fall of 1917 as the United States took an increasingly important part in the war, it became apparent that it would be impracticable for the United

States to fight Germany without opposing her most important ally. Recognizing this situation President Wilson, in his message which he read to Congress on December 4, called for an immediate declaration of war against Austria-Hungary. Acting upon this suggestion Congress on December 7 declared war on Austria (see UNITED STATES AND THE WAR). This action aroused no such debate or bitter feeling in Congress as developed when war was declared against Germany. In the Senate the vote was taken after an hour's debate and was passed 74 to 0. Senator La Follette, who had temporarily left the House to prepare an amendment which he wished to propose, was not present when the vote was taken. When he returned to the chamber he stated that he had not expected that the vote would be taken so soon. He then read the amendment which he had intended to propose providing that the United States should not be bound by any prior agreements among the Entente Allies to dismember the Austro-Hungarian Empire. With that added to the war resolution, he stated that he would have supported it as a necessary war measure. After three hours of debate the House of Representatives passed the resolution by a vote of 365 to 1. The single negative vote was cast by the Socialist, Meyer London, of New York City.

**ADDITIONAL BELLIGERENTS.** The addition of the United States to the belligerents profoundly influenced other neutral states, especially the Central and South American republics. Some had suffered severely from the German submarine campaign and were encouraged to follow the lead of the United States in breaking with Germany. Others that had not suffered material damage were influenced by the close ties which bound them to the United States. Of the latter group were Cuba and Panama, both of which broke with Germany the day following the declaration of war by the United States, the former declaring war and the latter promising support.

Brazil severed diplomatic relations with Germany on April 10. Continued sinking of Brazilian vessels resulted in the further step by Brazil of revoking her decree of neutrality on June 28, and the seizure of all German vessels in Brazilian ports. This condition of quasi-warfare continued for several months. Finally, on October 26, the Brazilian Congress formally declared war on Germany.

Long drawn-out negotiations between Germany and Argentina were ended by a statement made by the German government on August 28 that no more Argentine vessels would be sunk without warning. The controversy was, however, almost immediately reopened, as a result of the publication by Mr. Lansing of a number of intercepted dispatches which disclosed the fact that the German Chargé d'Affaires in Argentina, Count Luxburg, had recommended that if Argentine vessels were destroyed, it should be done "spürlos versenkt" (without a trace being left) (see UNITED STATES AND THE WAR). The Argentine authorities immediately requested Count Luxburg to leave the country and both branches of Congress voted to sever diplomatic relations with Germany. President Irigoyen, however, hesitated before taking this final step until the German government should be heard from. When the latter repudiated the

action of its representative, the president refused to carry out the decree of Congress.

Of the remaining Spanish American states the following severed relations with Germany, but did not declare war: Bolivia, April 13; Guatemala, April 28; Nicaragua, May 19; Costa Rica, September 21; Peru, October 7; Uruguay, October 7; Ecuador, December 8. The republic of Liberia severed relations with Germany on May 9 and the Kingdom of Siam declared war on Germany and Austria July 21.

China severed relations with Germany March 14. As to further action leading to China's active participation in the war opinion was divided in China. The president and a majority of Parliament opposed the military party, headed by the premier, and refused to consent to the declaration of war. This led to an abortive royalist revolution (see CHINA). With the suppression of the royalist uprising, the reconstituted republican government declared war on Germany and Austria on August 14.

GREECE. For an account of the blockade and the ultimatum of the Allies, see preceding YEAR BOOK, articles, GREECE, *History*, and WAR OF THE NATIONS. On June 11, M. Jonnart, a French senator acting for the Allies, notified the Greek authorities that King Constantine must abdicate in favor of his second son, Prince Alexander. The following day King Constantine abdicated and M. Venizelos, who had headed the insurrectionary government in Greece since September, 1916, became premier. The new government immediately declared its complete adhesion to the Allied cause, and declared war on Germany and Bulgaria on July 2. See GREECE, *History*.

PEACE PROPOSALS. Throughout the year 1917 evidence accumulated that the sentiment for peace in many, if not all, of the belligerent countries was growing. Expressions of war-weariness were becoming frequent. The confident and uncompromising attitude of the leaders of both sides showed distinct evidences of change.

In the closing weeks of 1916 the German chancellor made a proposition that the belligerents should "enter forthwith into peace negotiations." This was followed by a suggestion from President Wilson that all of the belligerents state precisely the objects for which they were fighting. See NEW INTERNATIONAL YEAR BOOK for 1916.

The president's note was cordially received throughout the Central Empires, and was interpreted there as supporting their peace proposals, although the president had clearly stated that his inquiry was in no way inspired by these proposals. Among the Entente Allies the note gave rise to bitter resentment. On the other hand most of the important neutral Powers endorsed it. On December 26, 1916, the German government replied to the president's proposal and suggested "an immediate meeting of delegates of the belligerents at a neutral place," but failed to make any definite reply to the concrete questions raised by the president. The reply of the Entente Powers was sent on January 10, 1917. It was far more specific than that of the Central Powers. It defined clearly what the Allied Powers understood by the formula "restitution, reparation, and guarantees" which the British premier had proclaimed as a necessary requisite to peace. "Restitution" meant the evacuation of Belgium, Serbia, Mon-

tenegro, France, Russia, and Rumania, together with the restitution of "provinces or territories wrested in the past from the Allies by force of arms or against the will of these populations." In addition the territorial rearrangements were to be made "upon the principle of nationality," by the "liberation of Italians, of Slavs, of Rumanians, and of Teheco-Slovagues from foreign domination" and the "enfranchisement of the populations subject to the bloody tyranny of the Turks" and also the "expulsion from Europe of the Ottoman Empire." "Reparation" meant "indemnities for damages suffered." In a supplementary note sent by the British foreign minister, Mr. Balfour, it was stated that any durable peace would require "some form of international sanction."

With these replies as a basis, President Wilson made a further effort to bring about a discussion of peace terms, when in a remarkable address delivered before the Senate on January 22, 1917, he outlined the kind of peace the United States could join in guaranteeing. He stated that it was inconceivable that the United States should play no part in the great enterprise for establishing a durable peace, and if it was to play a part, it was desirable to state frankly the conditions which this country regarded as essential to a durable peace. First it must be a "peace without victory." Further it must recognize equality of right among great and small nations; it must accept the principle that "governments derive all of their just powers from the consent of the governed"; subject peoples should be freed, citing as an example the case of Poland; "every great people" should have "direct outlet to the great high-ways of the sea"; "freedom of the seas" should be guaranteed; provision should be made for limitation of armaments on land and sea.

This statement gives striking evidence of the extent to which the United States had departed from its traditional policy of isolation from European affairs. The president appeared to recognize this fact and labored to show that there was no change in our traditions contemplated. He pointed out that he was simply proposing the extension of the principle of the Monroe Doctrine as the doctrine for the whole world. The Entente Allies did not receive the president's suggestions with favor, being especially opposed to his suggestion of a "peace without victory." The German government expressed general agreement with the principles stated in the note, calling attention to the necessity of granting "self-government and equality of rights" to Ireland and India, as well as to other small nations. It was stated that the annexation of Belgium "had never formed a part of Germany's intentions." It further accused the Entente Allies of responsibility for prolonging the war and stated that the Allies had spurned Germany's peace offers. The latter had determined to shorten the war by the inauguration of a campaign of ruthless submarine warfare after February 1, 1917. This statement brought about an immediate break of diplomatic relations between Germany and the United States (see above, *United States Enters the War*), and ended the efforts of the United States as a neutral to bring about peace.

RUSSIAN PEACE MOVEMENTS. The surprising and dramatic revolution in Russia in March, 1917 (see RUSSIA, *History*), profoundly affected

the whole war situation. From one point of view it materially strengthened the Allied cause. The alliance of the Russian autocracy with the great democratic states of western Europe in a war which the Entente had proclaimed as a struggle between autocracy and democracy, was, to say the least, anomalous. But with the deposition of the czar and the proclamation of the Russian republic, the moral position of the Entente Allies was greatly strengthened. An incongruous element had been removed and the great war appeared far more clearly as a struggle between the principles of autocracy and democracy.

On the other hand the new Russian régime did not associate itself with all of the war aims of the Allies. The radical revolutionary government showed little sympathy with the imperialistic ambitions of the Russian autocracy, and no desire to aid similar imperialistic aims of other nations. The Russian workingmen hoped to bring about a democratic peace by appealing to the working classes in all the warring nations. Their slogan was "peace without annexations or indemnities and based upon the right of all nations to decide their own fate." See *RUSSIA, History*.

Undeterred by the failure to obtain complete acceptance of its formula the Russian provisional government continued its efforts for an early peace. The Russian Council of Workingmen's and Soldiers' Delegates issued a call in May for a congress of the International Socialists, consisting of delegates from all the warring and neutral nations, to meet at Stockholm to discuss peace terms. This move was not received with favor by the Entente Allies and the United States. The government of the United States refused to issue passports to the American delegates and similar action was taken by France and Great Britain. This action foredoomed the conference.

Germany hoped to profit by this apparent breach in the ranks of her enemies. On May 15 the German chancellor made a bid for a separate peace with Russia. This move met with no success.

High hopes were aroused in the Entente countries that the Russian revolution would cause serious internal disorders in Germany, and there is evidence that the German authorities were decidedly uneasy. They made haste to promise democratic reforms, but no immediate progress was made toward the realization of these promises, and in July a serious political crisis developed. See *GERMANY, History*.

**POPE BENEDICT'S PEACE PROPOSAL.** The next peace effort came from neither of the belligerent groups. In a note dated August 1, 1917, Pope Benedict XV called upon all the belligerent Powers to consider the possibilities of an early and stable peace. The Pope outlined the terms which he thought would assure "a just and lasting peace": 1. the replacing of material force by "the moral force of right"; 2. a "simultaneous and reciprocal decrease of armaments"; 3. settlement of international disputes by arbitration; 4. a guarantee of "true freedom and community of the seas"; 5. mutual renunciation of indemnities, although allowing for exceptions where "certain particular reasons" would seem to justify it; 6. evacuation and restoration of all occupied territories; 7. an examination "in a conciliatory spirit" of rival territorial claims

such as those of Alsace-Lorraine and the Trentino, taking into account "the aspirations of the population." To this note President Wilson replied on August 27. He pointed out that the actions of the present German government made it impossible to enter into any negotiations with it, and called upon the German people to repudiate their "irresponsible" government. At the same time the president indicated that it was no part of the plan of the United States to join in a movement for crushing the German people. He repudiated the idea of "punitive damages, the dismemberment of empires, the establishment of selfish and exclusive economic leagues" as "inexpedient and in the end worse than futile." For full text of the note, see *UNITED STATES AND THE WAR*. The Entente Allies generally accepted the president's statement as embodying their views, and made no separate replies to the Pope.

Commenting upon the proposal of the Pope, Dr. Michaelis stated to the main committee of the Reichstag on August 21, that the German government was in general sympathy with the aims expressed in the note, but that a detailed reply could not be made until an agreement had been reached with Germany's allies. The chancellor repudiated the statement made by the enemies of Germany that the Pope's note had been inspired by the Central Powers. The official replies of Germany and Austria to the Pope's note were made public on September 22. Both notes expressed sympathy with the suggestion of substituting "moral power of right" for the "material power of arms." They likewise approved the limitation of armaments and the guarantee of the freedom of the seas. But upon the vital questions of restoration of conquered territory and the payment of indemnities both notes were silent.

Upon these two questions, however, the German foreign secretary in a speech before the Reichstag on October 10 threw some light. He stated that except for France's demand for Alsace-Lorraine "there is absolutely no impediment to peace, no question which could not be solved by negotiations or a settlement in such a way as to render superfluous the further sacrifices of blood." If sincere, this statement indicated a willingness on the part of Germany to meet the Entente's and the Pope's demands for a restoration of conquered territory.

**RENEWAL OF RUSSIAN PEACE MOVEMENT.** Failure on the part of the Russian revolutionary government under the leadership of M. Kerensky to persuade the Entente Allies to restate their war aims in conformity with the Russian peace formula, caused increasing restlessness in Russia. Time and again M. Kerensky promised the Russian people that the Allies were about to hold a conference to revise their war aims, but on each occasion the date of the conference was postponed. In despair M. Kerensky on November 1 served notice on the Allies that Russia was worn out and that the other Allies would thereafter have to shoulder the burden. While M. Kerensky added that his statement did not mean that Russia was going to withdraw from the war, nevertheless his speech aroused great concern among the Entente Powers. It probably hastened the announcement that the long deferred Allied conference would meet in the latter part of November in Paris. But the hope that the conference would satisfy the longing in

Russia for peace, by revising the war aims of the Allies in such a way as to make a general peace move possible, was not realized. Mr. Bonar Law in the House of Commons announced for the Allies that the conference would not deal with "political" matters, that is, the revision of war aims, but would concern itself simply with the discussion of more effective means of prosecuting the war. This statement caused bitter disappointment in Russia and contributed not a little to undermine the authority of M. Kerenky's government. On November 7 it was announced that the extreme radical elements in Russia, known as the Bolsheviks or Maximalists, had seized control of the government offices in Petrograd. See *RUSSIA, History*.

In the meantime the leaders of the Bolsheviks published a number of documents found among the papers in the Russian foreign office, which disclosed the arrangements which had been made among the members of the Entente in the early part of the war. There was little in the documents that had not been generally known—Russia was to acquire the Dardanelles, Constantinople, the west shore of the Bosphorus, and certain defined areas in Asia Minor. Arabia was to be placed under a separate Mussulman government. Russia agreed to allow France and England to define the western boundaries of Germany, and Russia was given a free hand to define the eastern boundaries of Germany. In return for joining the Entente, Italy was to receive the Trentino, southern Tirol, Trieste, Istria, and Dalmatia, to control the foreign relations of Albania, to obtain certain rights in Lybia, and to receive additional holdings in Africa if France and Great Britain increased their territorial possessions there. Greece was to receive part of Albania and certain Turkish territory in Asia Minor, if she would join the Allies. Leon Trotsky, the Maximalist leader, stated that his purpose in publishing these documents was to disclose to the people of all nations the plans made by "financiers and traders through their parliamentary and diplomatic agents." He warned Germany that "when the German proletariat by means of revolution secures access to their chancelleries they will find documents which will show up in no better light."

On December 8 it was announced that a ten days' truce to begin December 7 had been agreed upon between Germany, Austria-Hungary, Bulgaria, and Turkey on the one side, and Russia on the other. The following day Rumania also agreed to the truce. The Russian delegates then submitted a proposition to Germany that all of the belligerents be asked to take part in reaching an armistice on all fronts. For an account of the armistice, see *RUSSIA, History*.

Immediately after signing the armistice peace negotiations were begun at Brest-Litovsk, headquarters of the German commander in the east. The Russian delegates were reported to have submitted a series of proposals calling for the evacuation of all Russian territory occupied by German troops; autonomy for Poland, the Lithuanian and Lettish provinces, and Armenia; settlement of the question of Alsace-Lorraine by plebiscite; restoration of Belgium, Serbia, and Montenegro with indemnity for damages to be provided from an international fund; Rumania to recover all her former territory, with a grant of autonomy to Dobruja; autonomy for

Trent and Trieste until a plebiscite is taken; Greece and Persia to be restored; other contested territory in the Balkans to enjoy temporary autonomy until a plebiscite is taken; return of the German colonies; neutralization of all maritime straits, including the Suez and Panama Canals, freedom of commercial navigation; prohibition of torpedoing of commercial ships by international agreement; no war indemnities and all contributions exacted since the beginning of the war to be returned; no commercial discriminations after the war; peace conditions to be settled by a peace congress composed of delegates chosen by national, representative bodies; gradual disarmament on land and sea. These proposals clearly contemplated a general peace, not simply a separate peace between Russia and the Central Powers.

On December 25 the Central Powers, speaking through Count Czernin, the Austro-Hungarian foreign minister, replied to the Russian peace proposals. He stated that the representatives of the Allied Teutonic Powers "acting upon the clearly expressed will of their governments and peoples will conclude as soon as possible a general peace." He declared that the Central Powers believed that the basic principles laid down by the Russian delegates could form the basis of such a peace. He said they shared Russian condemnation of a continuation of the war for the sake of conquest and that they were prepared to conclude peace "without forcible annexations and indemnities." He added, however, that the Russian proposals could be realized only in the event that all the belligerents obligated themselves to adhere to the terms of such a peace. Specifically answering the propositions submitted by the Russian delegation, the Austro-Hungarian foreign minister stated that "forcible annexation of territories seized during the war does not enter into the intentions of the Central Powers." They did not, moreover, intend to deprive of political independence those nations which had lost it during the war. As to the Russian proposition that all subject nationalities should have the right of self-determination of their political status, it was stated that the Central Powers did not consider that this question could be solved internationally, but that it should be solved "by each government, together with its peoples, in a manner established by the constitution." In this connection it was indicated that the protection of the rights of minorities constitutes an essential part of the right of peoples to self-definition.

On the question of indemnification for war expenditures and war damages the language was somewhat vague. Count Czernin pointed out the possibility that all belligerents might renounce such payments. In such a case he stated that every belligerent Power would have only to make indemnification for expenditures for its nationals who had been made prisoners of war, "as well as for damage done in its own territory by illegal acts of force committed against civilian nationals belonging to the enemy." The proposal of the Russian government that a special fund be provided by all the belligerents for this purpose could be considered only in the event that the other belligerents join in the peace negotiations "within a suitable period."

As to the German colonies it was stated that their return constituted an essential part of the German demands "which Germany cannot re-

nounce under any circumstances." The application of the principle of self-determination to the German colonies could not be admitted in view of the nature of the population of these colonies. Finally in regard to the question of economic relations after the war the Central Powers expressed their complete approval of the Russian proposal that no economic restrictions should be tolerated.

While addressed directly to Russia these various propositions were obviously intended for the consideration of all of the Entente Allies and the United States. They constituted the first concrete statement of peace terms made by the Central Powers. In many respects the terms suggested are remarkable. There was in them none of that self-confident and arrogant assertiveness, of the "will to conquer," and of the determination to impose a peace upon Europe, which had characterized so many of the outgivings of the Teutonic war leaders in the earlier years of the war. It is noteworthy, too, that the Teutonic statesmen are careful to state that the proposals are made not simply by the governments but upon "the clearly expressed will of their peoples." Making all allowances, the spirit and language of these proposals indicate a striking change in the mental attitude of the Teutonic authorities.

Contrasted with the terms of the Allies as defined by President Wilson the outstanding differences are: First, that the Teutonic Powers make no offer to restore the devastated parts of Belgium and northern France; second, no reference is made by the Central Powers to the question of Alsace-Lorraine and the Trentino, and finally, the Teutonic note omits all mention of a world organization after the war.

Subsequent reports of the details of the Teutonic terms placed the situation in a quite different light. Germany agreed to withdraw her military forces from Russian territory as soon as the Russian army was completely demobilized. This arrangement was not to apply to Lithuania, Courland, and portions of Livonia and Esthonia. As the inhabitants of these regions had declared their independence of Russia, Germany proposed to retain military control in these territories indefinitely. There was to be no commercial discrimination against the subjects of either nation. The contracting parties were to grant one another, for at least twenty years, the rights of the most favored nation in questions of commerce and navigation. The administration of the mouth of the Danube River was to be entrusted to an international commission. No demands were to be made for the payment of war expenses on damages, except for damage done within the territorial limits of each state by acts contrary to international law.

These detailed proposals were so completely at variance with the reported statement of Count Czernin that they tended to confirm suspicion of the sincerity of the whole German peace move.

THE ALLIED CONFERENCE AT PARIS. The long deferred Allied Conference finally assembled in Paris on November 20. Delegates were present from Great Britain, France, Italy, the United States, and the other allied states, but none from the revolutionary government of Russia, which was then in the midst of its negotiations with Germany for an armistice. It had been

forecasted that the conference would concern itself, not with the definition of peace terms, but with formulating means of more effectively conducting the war. Mr. Lloyd George sounded the keynote for the conference in a speech which he made on November 12, on his return from Italy after the disastrous Italian defeat. He stated that the many reverses which the Allies had suffered were due to "national and professional traditions, questions of prestige and susceptibilities." He further stated that "No one in particular bore the blame. The guilt was in the natural difficulty of obtaining of so many nations, of so many independent organizations, that they should amalgamate their individual particularities to act together as if they were one people." The remedy he indicated was unity of purpose and action to be obtained by the creation of a Supreme War Council composed of the prime minister and another member from each of the Allied governments, together with a permanent military representative from each. Unless such unity was obtained he asserted that he was unwilling to accept any longer "responsibility for the direction of a war condemned to disaster from lack of unity." This speech caused a great stir in England and for a time it looked as if the premier's position was threatened. President Wilson in a message sent to Col. House, the head of the American commission to the Paris Conference, endorsed fully the movement for the bringing about of unified action and control among the Powers fighting Germany.

After a brief session of three days the conference ended. No detailed statement of the plans formulated by the conference was made, but it was indicated that satisfactory agreements had been reached whereby a unified and vigorous prosecution of the war was made possible. See *Military Operations*, Allied Unity.

DEFINITION OF WAR AIMS. There was a growing feeling among many people that the Entente Allies would greatly strengthen their position if a clear statement of their war aims was made. It was felt that if the German people could be convinced that it was not the intention of the Allies to crush them or to dismember their empire, it would encourage them to oppose the autocratic régime in Germany. Furthermore a definite renunciation of imperialistic plans on the part of the Allies might placate feeling in Russia and save that nation to the Allied cause. In England these views found expression in a noteworthy speech made by Lord Lansdowne, one of the most prominent Tory leaders. He pointed out the necessity for a restatement of the Allied war aims. He stated that on both sides the peoples of the countries involved "realize that the war has already lasted too long." He indicated that the Allies had done little to encourage the democratic forces in the Central Powers and he predicted that a great stimulus would be given to the peace party in Germany if it were understood that the Allies did not desire the annihilation of Germany as a great Power, that they did not wish to impose on the German people any form of government not of their own choice, that they had no desire to deny to Germany her place among the great commercial countries of the world, that the Allies were prepared to "examine, in concert with other Powers, a group of international problems, some of

them of recent origin, which are connected with the question of the freedom of the seas," and finally that the Allies were prepared to provide for the settlement of international disputes by arbitration. Lord Lansdowne's views were not generally well received in the Entente countries. On the other hand they were spoken of in Germany as a "hopeful sign."

The appeal of Lord Lansdowne was answered, in large measure, by President Wilson in his message read before Congress on December 4. The president's views were awaited with the greatest of interest not only in America, but throughout the whole civilized world. This interest was indicated by the fact that arrangements were made for the simultaneous publication of the message in all of the Allied countries. It was expected that the president would restate the war aims of the United States, particularly as the Allied Conference at Paris had disbanded without making any such statement.

Dismissing as unnecessary any further statement as to the causes of the war the president proceeded to state explicitly the purposes for which the United States was fighting. He denounced in scathing terms the German autocracy and asserted that peace could come only when this autocracy was beaten down, "when the German people have spokesmen whose word we can believe," when they make reparations for the wrongs their present rulers have done and when the enslaved people of Belgium, northern France, and the Balkans have been set free. Moreover, the control of the Germany autocracy in Austria, Bulgaria, and Turkey must be broken. At the same time the president stated that it was no part of our task nor did we desire to break up the Austrian Empire. He emphasized the point which he had made in former statements that we had no desire to crush the German people or to exclude them from the family of nations when they had organized a responsible government. He indicated that if this purpose had been made clear by the Allies at the outset many of their sad reverses would have been averted. Particularly would it have enlisted and held the sympathy and enthusiasm of the Russian people. Having restated thus the war aims of the United States he dwelt upon the necessity of pressing the war vigorously to a successful conclusion. He deprecated all talk of peace until that end was reached.

**NEUTRAL NATIONS.** The entrance of the United States into the war deprived the neutral powers of their most powerful advocate. So long as the United States acted as the champion of neutral rights, at least a measure of the privileges of neutrals as formerly interpreted by international law had been preserved. Particularly had Great Britain hesitated to press completely her blockade policy for fear of a possible break with the United States. But with America as a belligerent the situation was materially changed. No other neutral nation was sufficiently powerful to seriously challenge whatever policy the belligerents might choose to inaugurate. It was clear, therefore, that neutral rights would be still more narrowly restricted. Such a policy would affect most seriously the Scandinavian states and Holland, through whose territory supplies reached Germany despite the British blockade. To meet this situation, President Wilson on July 9 issued a proclamation placing under government control all exports of

fuel, food, fodder, iron, and steel. Loud complaints were made by neutral countries and commissions were sent to the United States to make some satisfactory arrangements, but at the close of the year no announcement had been made of any agreement.

#### IV. MILITARY OPERATIONS

##### (1) *Russian Winter Offensive (January)*

During the first week in January, the Russians began an offensive on the northern end of their battle line (southwest of Riga), in order to relieve the pressure on the Carpathian and Transylvanian fronts. It was practically a repetition of the unsuccessful offensive of the previous winter under Gen. Kuropatkin. The battle area of the new offensive consisted of the swampy land extending east as far as Riga, south to Mitau, and west to Tuksum. It is traversed by the Aa River, which flows into Babit Lake. The Russians attacked along the Dwina in the neighborhood of Dvinak and had for their ultimate objective Mitau, on the Mitau-Riga-Libau Railroad. On January 10 the Russians advanced more than a mile and captured German fortified positions between the Tirul swamp and the Aa River. In heavy fighting in the Babit Lake region they took several thousand prisoners and over thirty guns. Their attacks were aimed chiefly at the village of Kalnzem, which is the nearest village to Mitau. Their advances were abruptly halted when the Germans began a counter-offensive on both banks of the Aa on January 25, which resulted in the capture of 2000 prisoners and the retirement of the Russians to their original line. Germany followed this success up with strong attacks on the Dwina front, in Volhynia, and East Galicia, with the result that the entire Russian movement collapsed.

##### (2) *Complete Collapse of Rumania (January-February)*

When the year 1916 closed, all of Wallachia had been occupied by the Teutonic forces and the Rumanians were strongly defending Moldavia on a line southwest of Fokchany and Braila. In the Dobruja the Russo-Rumanian army under Gen. Sakharov was gradually being forced back toward the lower stretches of the Sereth River, but was fighting a strong defensive battle on the narrow tongue of land in the loops of the Danube east of Braila and Galatz.

During the latter part of December, 1916, the Teutonic forces crossed the Buzeu River and found the Slavic allies defending the line of the Rimnicu River. This was a small stream almost paralleling the Buzeu and possessing little defensive value. It took a week of bitter fighting, however, before the Germans were able to dislodge the Russians. The capture of Rymniku-Saratu marked the fall of this line and compelled the Russians and Rumanians to retire further toward the line of the Sereth. This retirement was pivoted on the Danube positions south of Braila. The Teutons then struck north of Rymniku-Saratu and on January 8 the important city of Fokchany was captured. A new defensive line was formed on the upper reaches of the Putna River, but it was only held for a few days when the Russians were compelled to retire to the north bank of the Sereth, near its confluence with the Putna.

**RULERS OF FOUR NEUTRAL STATES IN 1917**

The complete conquest of Wallachia and the Dobruja, with the forced retirement of the Russo-Rumanian centre and right wing, put their left wing in a precarious position. It was exposed to an enflaming fire from three sides. On the rear and one flank it was under the fire of the German batteries on the eastern bank of the Danube. In the front it faced the German trenches. This critical situation compelled a retirement toward Galatz. The Matchin bridgehead fell on January 3 and on the fifth the important city of Braila was captured. Vadeni was taken on the fourteenth, but was retaken by a counter assault on the seventeenth. This town is only six miles from Galatz, but is on the southern bank of the Sereth.

In the meantime the battle on the Moldavian front had been increasing in bitterness, inasmuch as the Russo-Rumanian resistance was stiffening, accompanied by spasmodic attempts at offensive warfare in the Kasino River section. This offensive was unsuccessful, as were others attempted in the Suchitza and Trotus River valleys. These rivers are small rapid streams flowing into the Sereth from the west. Another Russian offensive (January 28) on the Kimpolung-Jacobi road broke through the German lines on a two-mile front, but the positions were regained by the Germans by the middle of February. Snow and inclement weather held up further German advances. On February 15, their line ran roughly as follows: West of the Togyes and Gyimes passes, east of the Carpathians as far as the region west of Firgo Okna, east of Oitoz Pass to the Putna, along that river to the east of Fokchany to the Sereth, along the Sereth to Braila, and then across the Danube into the Dobruja.

This line practically marks the high tide of the German conquest of Rumania. It was almost impossible for the Austrians to bring men and supplies across the wooded Carpathians. The Russian revolution also caused the Germans to halt operations, possibly with the idea of making peace with revolutionary Russia. The only operations of any moment on the entire Rumanian front after February were locally successful diversions after the breakdown of the Russian offensive under Brusilov in July. Force of circumstances compelled Rumania to enter the Russian and German armistice signed in December, 1917.

Military experts had severely criticized Rumania for rushing into Transylvania immediately after the declaration of war and thus leaving her flank open to attack. A partial explanation of this serious blunder was given to the world after the Russian revolution. It seems that Stürmer, the Germanophile premier of Russia, had promised to send a Russian army of 1,000,000 men, fully equipped, to protect the exposed flank. He purposely withheld this army until it was too late and the fate of Rumania had been sealed. See *RUMANIA, History*.

### (3) *Continuation of the Battle of the Somme (January-March)*

The winter months of 1916-17 were a period of busy activity behind the British and French lines on the Somme battlefield. The British had gradually extended their line in this sector so that by February it reached to a point opposite Roye. Their line was now 110 miles long

and included practically the entire Somme front, which was a very sorry spectacle. Trenches had been destroyed, roads torn up, and almost every square foot of terrain was pit-marked with shell holes. The British directed their energies during the months of inactivity in building new trenches, repairing old ones, repairing railways, roads, and other means of communication, and in bringing up their artillery to suitable locations for the renewal of the drive, from where it had ceased in November, 1916.

When it was possible to continue hostilities (January, 1917), the British began to carry out a number of local engagements to drive the Germans from the remainder of the Beaumont Hamel Spur in the Ancre River region. On January 11, 1500 yards of trenches along the top of the spur, east and northeast of Beaumont Hamel, were taken. By the end of the month all the high ground north and east of Beaumont was taken and the British had pushed across the Beaucourt valley and had gained a footing on the spur to the east.

### SCENE OF BATTLES IN THE VALLEY OF THE ANCRE

The possession of the high ground gave the British artillery domination of the entire Beaucourt valley and the western slopes of the spur beyond from Grandcourt to Serre. The plan of attack was now to clear the valley and push on to the crest of the spur beyond, which formed a part of the Germans' original second line system north of the Ancre. On the night of February 3-4 the British captured German positions on a front of approximately three-quarters of a mile. This success was marked by extremely bitter counter assaults, but brought the British line level with the

centre of Grandcourt and seriously threatened the German hold on that village and their other lines south of the Ancre. Consequently, on February 5, British patrols discovered that the German lines between Stuff Redoubt and Grandcourt had been evacuated. The next day the British entered Grandcourt, which had also been abandoned.

On February 10 the British seized positions lying at the foot of Serre hill (other side of Ancre from Grandcourt), and held them against strong counter attacks delivered on their new positions in the next two days. As a result of two attacks delivered north and south of the Ancre on February 17-18, the British gained important high ground which gave them complete command of the German artillery positions in the upper Ancre and the defenses of Pys and Miraumont. The possession of the latter village would seriously threaten the village of Serre, which formed the tip of a narrow salient. Again the possession of Serre would threaten the defenses of Puisieux-au-Mont and Gommecourt, and thus possibly compel the necessity for a further German withdrawal.

On February 24, it was discovered that the German positions before Pys, Miraumont, and Serre had been abandoned. They were immediately occupied by British troops. On the twenty-fifth the German first system of defenses from north of Gueudecourt to west of Serre were taken by the British. They were found to be defended by machine gun units placed in selected strategic points and by artillery stationed several miles in the rear. The British losses as a result were exceedingly light.

The Germans retired to a strong secondary defence which ran from a point in the Le Transloy-Loupard line due west of the village of Beaulencourt, crossed in front of Ligny-Thilloy and Le Barque to the southern defenses of Loupart wood. Between February 25 and March 2, this entire line was taken along with the villages of Le Barque, Ligny-Thilloy, and Thilloy. Operations on the north side of the Ancre resulted in the abandonment by the Germans of Gommecourt (February 27) and Puisieux-au-Mont (February 28).

The Germans were now forced back to the Le Transloy-Loupard line with the exception of Irles, which was the tip of a salient hooked up to the main line at Loupart wood and Achiet-le-Petit by a series of well constructed and fortified trenches. After a week's preparation, which was spent mostly in bringing up guns and ammunition, and in repairing roads, Irles was assaulted on March 10 and its whole system of defenses occupied. This prepared the way for a direct attack on the Le Transloy-Loupard line. It was heavily bombarded on March 11, and as a result of the bombardment was abandoned during the night of March 12-13. Gréville and Loupart wood were occupied by the British, thus bringing Bapaume, one of the main objectives of the great battle of the Somme, within effective artillery range.

#### (4) *Mesopotamian Campaign (February-October)*

We have found (NEW INTERNATIONAL YEAR BOOK for 1916) that as a result of the fighting in 1916, the Allies had been absolutely unsuccessful in the fighting in Armenia, Persia, Kur-

distan, and Mesopotamia. While the Russians had wrested old Armenia (just south of the Black Sea) from the Turks, the latter had resisted all efforts to get control of the Bagdad route. They had defeated three Russian expeditions and one British expedition which had this object in view. The British operation had ended in disaster by the capture of Gen. Townshend's expeditionary force at Kut-el-Amara on April 30, 1916. Throughout the remainder of that year the relief expeditionary force under Gen. Aylmer had, with difficulty, held positions in the neighborhood of the town. The British Staff prepared minute plans for the retrieving of Gen. Townshend's disaster and was ready to put them into operation in the early part of 1917. The size of the army was increased and boatloads of supplies and equipment were rushed up the Tigris River to ensure the new movement of a fair degree of success.

In February the weather conditions were favorable to the renewal of fighting. The transport system was in first-class working order and several river monitors had been sent up the Tigris to aid the army in its offensive. Owing to the comparative lull on the other fronts during the winter, the Mesopotamian campaign became the chief object of interest in the war.

As a result of a series of local engagements and manœuvring for position, the British, by the middle of February, had established their lines on both banks of the Tigris, where it formed a bend west of Kut-el-Amara, and, consequently, hemmed the Turks in this town. The operations were in charge of Gen. Sir Stanley Maude, who, unfortunately for the British, died later in the year. The British plan as stated by Gen. Maude were as follows: First, to secure possession of the Hai River; secondly, to clear the Turkish trench systems still remaining on the right bank of the Tigris; thirdly, to sap the enemy's strength by constant attacks, and give him no rest; fourthly, to compel him to give up the Sanna-i-yat position, or in default of that to extend his attenuated forces more and more to counter our strokes against his communications; and, lastly, to cross the Tigris at the weakest part of his line as far west as possible, and so sever his communications. The object of this offensive campaign was to counteract the threatened Turkish stroke on India through Persia.

It took Gen. Maude two months to clear the right bank of the Tigris, very bitter and severe fighting occurring in the Dabra bend of the river. On February 23, in the face of heavy fire he ferried some of his troops across the Tigris, under the protection of the artillery and machine gun fire. These secured a firm hold on the opposite bank and thus permitted the construction of a pontoon bridge. On the next day part of Shamrun peninsula and Sanna-i-yat, the keys to Kut-el-Amara, were taken. The Turks believed these positions to be impregnable, and made gallant though costly efforts to retain them. The fall of these important positions compelled the Turks to abandon Kut-el-Amara and retreat up the river toward Baghela, twenty-four miles away. The British by a forced march attempted to intercept them, but the Turks, throwing away all accoutrements, moved too rapidly and escaped envelopment.

British cavalry pursued the fleeing Turks on their right, the infantry their centre, and the

Royal Navy gunboats on the Tigris, their left. These latter wrought considerable havoc on the Turks by getting ahead of them and firing on them as they approached. They totally destroyed the Turkish boats on the river and recaptured the monitors which had been lost with the surrender of Gen. Townshend's army. The pursuit was broken off at Aziziyeh, fifty miles from Kut, to enable the British to reorganize their extended lines of communications, preparatory to a further advance. The British then advanced about thirty miles up the Tigris to the Diala, where they again came in contact with the enemy. Sir Percy Lake, in command of the British left, crossed the Tigris some distance below its junction with the Diala, and started a march on Bagdad, twenty miles away. During March 7-10 the British forced the cross-

During June and July the Turks drove the Russians across the Persian border and left the British left wing in a very exposed position.

The Turks after the fall of Bagdad retreated up the Tigris toward Mosul and up the Euphrates toward Aleppo. The main army took the first route with the idea of holding the headwaters of the Diala, until they could rescue their army which was lost in Persia as a result of the Russian activity mentioned above. They had crossed the Persian border and actually joined hands with the British outposts. The British carried out a brilliant operation when they stormed Mushaidie ridge and railway station on March 14. On March 19, Gen. Maude seized Feluja, on the Euphrates, with the idea of ascending that river and capturing El Deir, which was the key to the crossroads leading to

#### SCENE OF OPERATIONS IN PALESTINE AND MESOPOTAMIA

ing of the Diala and on the latter date attacked the Turks from both sides of the Tigris and drove them into Bagdad. During the night the Turks evacuated the city, leaving in the hands of the British their own artillery, captured at Kut-el-Amara, and a great number of Turkish guns. The fall of Bagdad was not of great strategic importance, but had a great moral effect throughout the world. Besides the entire cultivated lands of Babylonia fell into the hands of the British.

While the British were carrying out these operations on the Tigris, the Russians for a time gave great promise of lending them substantial aid in the conquest of Turkey in Asia. A Russian offensive drove the Turks from Hamadan and had almost put them to rout when the Russian revolution occurred and upset the entire plans of the Mesopotamian campaign. The Turks were able to withdraw troops from the Armenian front to stem the British advance.

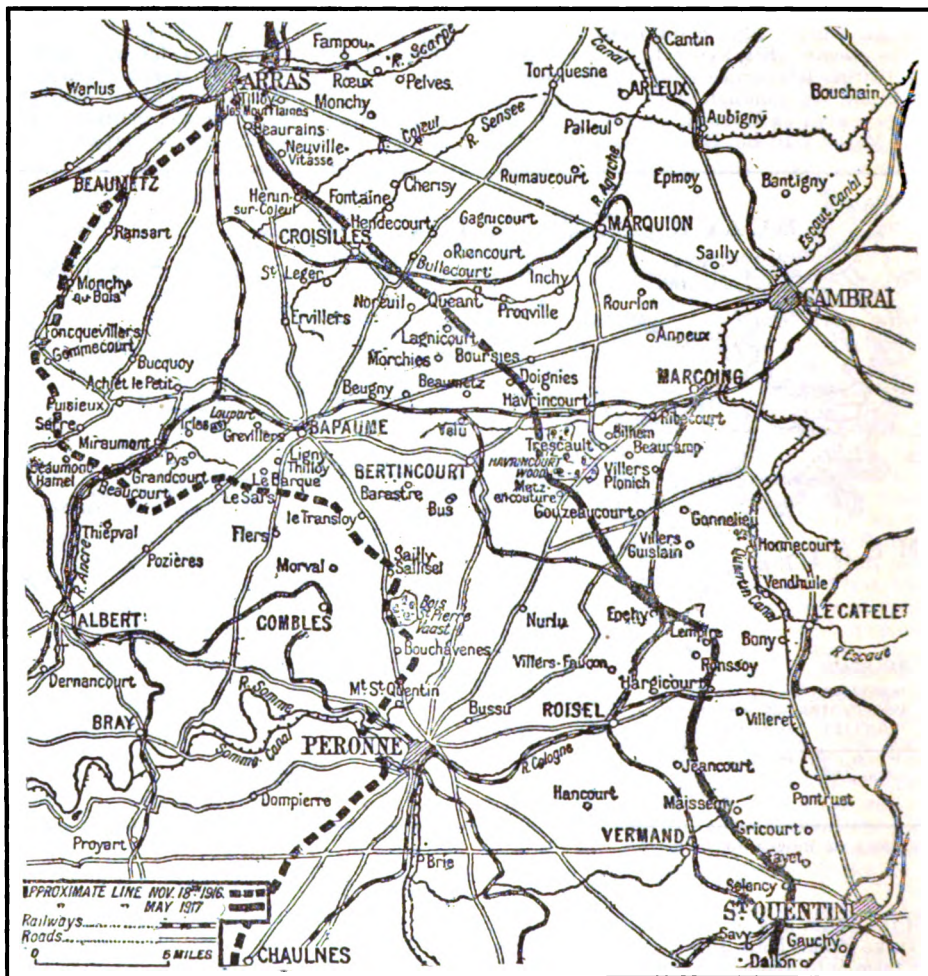

Damascus, Aleppo, and Mosul. His plan was to have the centre advance on Mosul, the right wing to clear the caravan route leading into Persia, and the left wing to secure El Deir. The first step accomplished in this advance was the capture of Samara on April 23, which secured the control of the Bagdad-Samara railroad and facilitated the bringing up of supplies. The British plans were again upset by the complete collapse of the Russian army and the occupation of Khanikan by the Turks (July). This place controls the caravan route from Bagdad to Kermansha.

The heat of the summer put an end to all fighting for the time being. When it was resumed the British captured the entire army of Ahmed Bey at Ramadie, on the Euphrates, on September 30. On October 5, the Russians took Nereman by assault. This is fifty miles north of Mosul, which was now threatened from the north and south. The British advanced nearer

to it by capturing Tekrit, fifteen miles north of Samara. Operations came to a decided halt here because the growth of the Bolshevik movement caused the Russian aid to fail. Gen. von Falkenhayn was sent to Asia Minor to carry on the work of Gen. von der Goltz, who had been assassinated. He spent the remainder of the year at Aleppo building up the Turkish armies.

Partially due to Allied success in Mesopotamia and Palestine, the Hejaz, a province of Turkey in Asia, revolted and declared its inde-

a withdrawal on a scale far greater than the one being carried out in the Ancre River valley. Air scouts and news obtained from prisoners showed that the Germans had been preparing an exceptionally strong defense system, known as the "Hindenburg Line," some distance behind their present front. This branched off from the main German defenses near Arras, then ran southwest to Queant, and then ran to the west of Cambrai in the general direction of St. Quentin. Various branch lines, or "switches,"

#### SCENE OF THE GERMAN WITHDRAWAL

pendence, under the leadership of the Grand Sherif of Mecca, Hujayn Ibn Aly, who took the title of king. The Entente Allies engineered this revolt, which won over the orthodox Arabs and Syrians opposed to Turkish rule. Arms and ammunition of the latest type were supplied to the revolutionists and they seized several Turkish towns and seriously hampered their Syrian railway system.

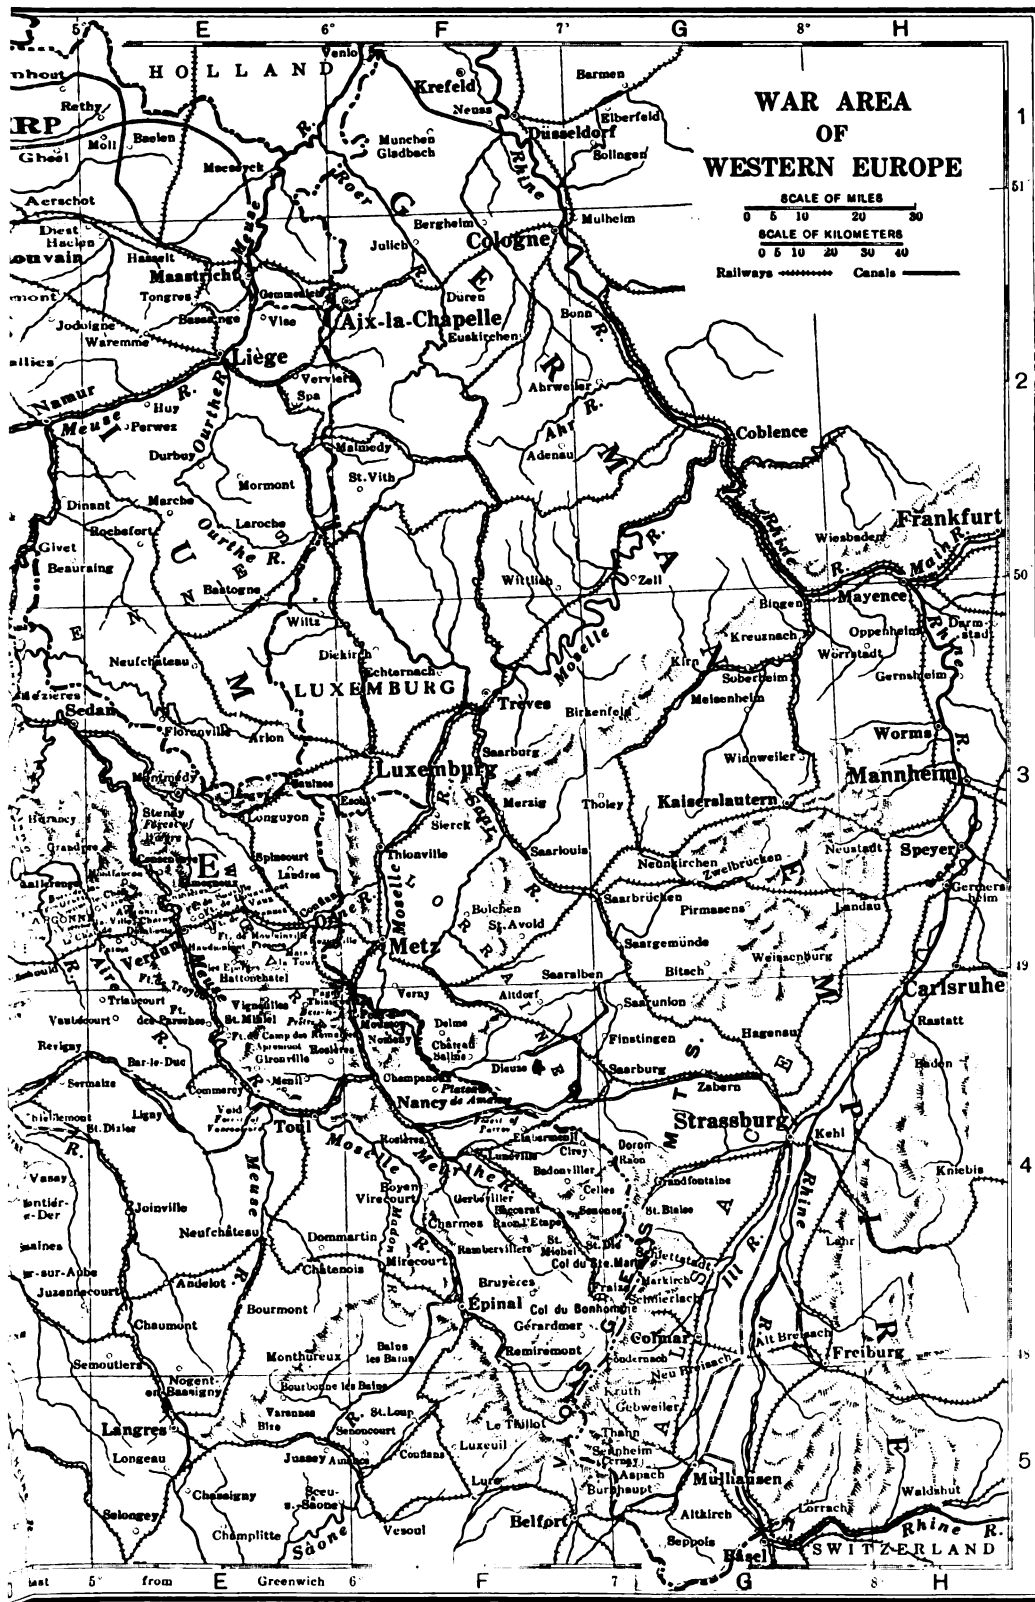

#### (5) The German Withdrawal (March-April)

Since the middle of March it had been fairly obvious that the Germans were contemplating

ran into this main line. The British advance up the Ancre had pushed further and further into the Arras-Le Transloy line, which was really a salient, and had made it untenable. The new "Hindenburg Line" also seemed to indicate a general retirement from the larger salient from Arras to Rheims, with its tip near Noyon. This is what eventually happened. Von Hindenburg used the same system of defense during his withdrawal that he developed in the Ancre valley. Machine gun units were placed in selected strategic positions to delay the advance of the British and French. Trenches were practically emptied of soldiers, who were used

to transport ammunition, etc., to the rear and to devastate the territory covered by the retreat.

When the British discovered on March 15 that part of the German positions had been abandoned in the neighborhood of the forest of St. Pierre Vaast, and that a general retirement was being carried out, Gen. Haig gave orders for a general advance along the whole line from Arras to Roye. The French simultaneously began to advance from Roye to Rheims.

Chaules and Bapaume fell to the British on March 17. Peronne and Mont St. Quentin were occupied the next day. On the same day (18th) the British crossed to the eastern bank of the Somme at Brie, while further south the British and French cavalry occupied Nesle. By the nineteenth British infantry north of Peronne held the line of Bussu, Barastre, Velu, St. Leger, and Beaurains, while the cavalry was in contact with the enemy at Nurlu, Bertincourt, Noreuil, and Henin-sur-Cojeul. On the next day infantry and cavalry held the line from south of Germaine (where the British joined the French) through Hancourt and Nurlu to Bus. Further north the British occupied Morchies.

As the British north of the Bapaume-Cambrai road between Noreuil and Neuville-Vitasse were within two or three miles of the "Hindenburg Line," which joined the old line at Tilloy-les-Mouffaines, the German resistance began to stiffen. Counter attacks of increasing violence were delivered by the Germans, but the British gradually but surely pushed them back to the "Hindenburg Line."

In the meantime the French pursuit on the southern part of the line went forward just as rapidly, if not more so, than the British. The rapid pursuit was evidently a surprise to the Germans who were almost unable to fight even a rearguard action. The French without fighting any serious engagements occupied Noyon (March 18) and ultimately reached Tergnier, a town within two miles of La Fere. Moving east from Tergnier they pressed the Germans back on the Oise River as far as Moy. This put the French in a position east of St. Quentin and enabled them to work their way to the rear of the town to a point south of Neuville. Their line then ran westward near the suburbs of the city and then along the high ground south of it. Although practically all the approaches to the city were under fire of French and British artillery, the Germans managed to hold the city throughout the rest of the year, inasmuch as counterthrusts regained the most threatening positions.

Further south along the Ailette River (see map under *French Offensive on the Aisne*, IV, 7), the French met a severe check. This river guarded the forests of Coucy and St. Gobain, which protect the southern defenses of La Fere. The French after extremely heavy fighting, however, crossed the river and took the village of Coucy and the lower forest of Coucy at the southern end of the line. They were unable to penetrate the forest of St. Gobain, which was now recognized as one of the chief defenses of the "Hindenburg Line."

The reasons given for this great withdrawal were many and varied. German reports called it a strategical retreat and stated that Hindenburg was shortening his line and at the same time was drawing the Allies out into the open

so that he could defeat them in a pitched battle. Another German report stated that the Germans were withdrawing to a new line in order to nullify the vast preparations the French and British had been making for a continuation of the battle of the Somme. The consensus of opinion among Allied military experts was that the withdrawal had been forced upon the Germans and was in no way voluntary. The British and French gains in the Somme and Ancre River valleys had threatened the entire Noyon salient to such an extent that further gains would have caused a gigantic German disaster. The restoration of French territory amounted to over 1000 square miles, containing between 350 and 400 towns and villages, which had a population of almost 200,000 before the war.

The territory abandoned by the Germans was a scene of horrible desolation. Wanton destruction was everywhere visible. The situation is probably best summed up in the contents of a note sent by the French government to its representatives in neutral countries against "acts of barbarism and devastation." "The government of the republic is now gathering the elements of protest which it intends sending to neutral governments against acts of barbarism and devastation committed by the Germans in French territory which they are evacuating while retreating. . . . No motive demanded by military necessities can justify the systematic devastation of public monuments, artistic and historical, as well as public property, accompanied by violence against persons. Cities and villages in their entirety have been pillaged, burned, and destroyed; private homes stripped of all furniture, which the enemy has carried off; fruit trees have been torn up or rendered useless for further production; streams and wells have been poisoned. The inhabitants, relatively few in number, who have not been removed, have been left with a minimum of rations, while the enemy seized stocks supplied by the neutral revictualing commission which were destined for the civil population.

"You will point out that this concerns not acts destined to hinder the operations of our armies, but of devastation having no connection with this object and having for its purpose the ruin for years to come of one of the most fertile regions of France.

"The civilized world can only revolt against this conduct on the part of a nation which wanted to impose its culture on it, but which reveals itself once again as quite close to barbarism still, and, in a rage of disappointed ambition, tramples on the most sacred rights of humanity."

The German authorities upheld this devastation on the grounds that the destroyed territory was liable to become a battlefield and consequently structures of any kind might become machine gun nests; fruit trees would supply food to the enemy, etc.

The total destruction of roads, railways, etc., presented tremendous problems to the British and French transportation and engineering sections. They performed almost superhuman deeds of construction and other engineering work. They built temporary bridges over streams, roads around craters thirty and forty feet deep where crossroads had been blown up, temporary roads through fields, with such great rapidity that time and time again they were at the heels of

the retreating Germans when they were supposed to be miles away. The speed of the pursuit can be estimated when it is stated that the Germans had rationed the civilians of some towns for five days and that these rations had scarcely been touched when the British and French entered the town.

one end, and St. Quentin, an important point in the "Hindenburg Line," at the other. The artillery preparation during the four days preceding the infantry attack, surpassed in intensity and destructiveness those preceding the German attack at Verdun and the Allied attack on the Somme. A word should be mentioned

From Current History Magazine, New York Times Co.

#### THE BATTLE OF ARRAS

##### (6) *The Battle of Arras (April-June)*

The German theory that the great Hindenburg withdrawal (March-April) was a strategic move to nullify tremendous preparations the British and French had been making during the winter months for a continuation of the Battle of the Somme, was exploded when the British began a gigantic offensive on April 9 in the neighborhood of Arras, and the French began a similar one from Soissons to Rheims, a few days later. The British struck on a front approximately forty-five miles long and they had for their objectives, Lens, the coal city, at

concerning the part played by aerial forces. The battle in the air was probably the greatest ever fought. The airplanes were in constant use in all kinds of weather, taking photographs of enemy positions, and bombarding strategic points. The "supremacy of the air," if such a term can be correctly used, was indubitably with the British.

The battle opened on Easter Monday morning (April 9) with a tremendous offensive on a twelve-mile front north and south of Arras, from Givenchy-en-Gohelle, southwest of Lens, to Henin-sur-Cojeul, east of Arras. The German positions were penetrated to a depth of

two or three miles and many important fortified positions, including Vimy ridge, were taken. The first "push" netted 6000 prisoners, several guns, and a great quantity of war material. The seizure of Vimy ridge was exceptionally important, inasmuch as it dominated the coal fields to the east. The task of taking it was left to the Canadians. Their way was made comparatively easy for them by the artillery preparation. The whole top of the hill was blown off and almost all the wire entanglements were swept away. An almost perfect "barrage" fire preceded the advancing waves of infantry. Prisoners stated that they had not been relieved or even fed for days because of the terrific gun fire. The Canadians took 2000 prisoners on Vimy ridge alone. This ridge was the northern "hinge" of the Hindenburg retreat in March and April, and a year ago the French had made extremely costly but unsuccessful efforts to hold the height.

On the second day of the battle, the British pushed still further on their line of original attack and added 5000 more prisoners and other great quantity of war material to their first day's gains. The infantry reached the outskirts of Monchy-le-Preux, five miles east of Arras. Further north the British advanced on both sides of the Scarpe River, and at the other end of the long battle line they made minor gains in the neighborhood of St. Quentin. In the centre, due west of Cambrai, the German defenses held firmly.

The weather conditions were very severe for April. It was exceedingly cold and a very heavy fall of snow necessarily hindered the activities of the armies. On the third day of the battle, the British captured Monchy, which the Germans had very strongly fortified. Every house and housetop was a machine gun nest, which made costly street fighting necessary. On this day the British also consolidated their gains and brought up their artillery. On April 12, the British took the villages of Wancourt and Heninel along with some strong positions north of the Scarpe. Severe counter attacks were made against the British positions at Monchy, but they were finally broken up by newly-arrived batteries.

On the fifth day of the battle the scene shifted. The British began offensives on both ends of their long line. Sweeping northward from their newly won positions north of Arras, they struck on a twelve-mile front from the Scarpe River to Loos, north of Lens, and advanced an average depth of about a mile. The town of Vimy was taken, as well as Ancre, which, with Lieven, protects Lens on the southwest. On the fourteenth, Lieven was also taken with a vast quantity of war material. On the afternoon of the same day the British entered Cité St. Pierre, northwest of Lens, and thus put the coal city in a dangerous "pocket." On the fifteenth, British troops entered the streets of the suburbs of the city itself and its fate seemed sealed.

While these operations were going on on the northern end of the line, the British attacked (April 13) on a nine-mile front from Metz-en-Couture, south of the Bapaume-Cambrai road, to Hargicourt, but failed to make any substantial progress because of the great quantities of reserves Gen. von Hindenburg had thrown into the battle line to prevent his famous defense line from being rolled up. At the extreme

southern end of the line the British had pushed their way to within a few hundred yards of St. Quentin, and had captured the village of Fayet in hand to hand fighting. All attempts to take the city itself, however, failed. The number of prisoners taken so far were approximately 15,000 and the number of guns nearly 200.

The battle of Arras now entered its second phase. The first phase, made after great preparation and with a certain element of surprise, had achieved success all along the line. The Germans now, however, knew where to expect attacks, and, consequently, vast quantities of men and material had been collected behind the "Hindenburg Line" to stem the British advance. As a result further British progress was to be a much harder proposition. On April 23, they attacked the so-called "Oppy Line," which was a switch line protecting the "Hindenburg Line" north and south of Vitry-en-Artois. The attack was made between Gavrelle, Guémappe, and Fontaine-les-Croisilles. The "Oppy Line" was protected by a great number of machine gun units placed in villages, trenches, and shell-holes, and could sweep any line of advance from the front and flanks. After six days of bloody fighting the British broke the "Oppy Line" when Canadian troops entered Arleux-en-Gohelle and English troops entered Oppy, and part of the village of Roeux. The Germans now began to make use of their reserves in a series of counter attacks, carried out by great masses of men. These broke down with terrific losses before the British positions at Gavrelle, Monchy, Guémappe, and Lagnicourt. The windmill at the first mentioned village changed hands no less than eight times up to May 4. Fresnoy was taken on May 3 by Canadian troops, but was retaken on May 8 by a furious counter assault. Australian troops entered Bullecourt (May 13-17) and Roeux was also captured (May 13-15). It would be almost impossible to relate here the fighting of the next three weeks. It was on a narrow front between Fresnoy and Queant. The British made advances in the neighborhood of Oppy, Roeux, and Bullecourt, but they were almost immediately nullified by German counter attacks. Because of the weight of men and material the Germans used in counter assaults they were almost invariably successful.

By the first of June it was apparent that the battle was at a deadlock. The Germans had a secure hold on Fresnoy, Oppy, Roeux, Pelves, and Cherisy. The British had a strong grip on Bullecourt. From a strictly military point of view the Germans had been victorious. The British failed to break the "Hindenburg Line" or its switch line from Drocourt to Queant, which was partially protected by the "Oppy Line." The only real military advantage gained by the British was the placing of the coal city of Lens in a dangerous "pocket," from which it was impossible to escape unless the famous Vimy ridge was retaken. The real advantage to the Allies was the carrying out of its policy of attrition, i. e., wearing the Germans down in manpower and material. The idea of the British general staff seems to have been to compel the Germans to counter attack rather than to have the British army conquer territory. Counter attacks cost far more lives than attacks well protected by barrage fire. It is also impossible to prepare for counter assaults with

artillery to any great extent, because the element of success depends on attacking the enemy before he is able to consolidate his newly won ground. The losses in the German counter attacks during the Battle of Arras were unequalled in the war and far exceeded those of the British.

(7) *The French Offensive on the Aisne (April-November)*

On April 16, the French began an offensive on the Aisne River, the object of which was to destroy the southern pivot of the Hindenburg withdrawal just as the British had destroyed the northern pivot at Vimy ridge on April 9. The battle line was twenty-five miles long, from Soissons to Rheims and the positions had been held by the Germans from the time they had retreated from the Marne. On the first day of the offensive the entire first line and part of the second line of German trenches were seized, along with 10,000 prisoners and a great quantity of war material. By April 9, 17,000 prisoners and seventy-five guns were officially counted by the French commanders. The villages of Chavonne, Chivy, Ostel, and Bry-en-Laonnais were taken. Further to the west, on the south bank of the Aisne, the French took Vailly and a strong bridgehead after a powerful attack. Following their policy adopted in the Battle of Arras, the Germans delivered fierce counter attacks, carried out by great masses of troops, against these newly won positions, but they broke down before the attackers reached the French lines, and the attackers themselves suffered tremendous losses. On April 19, between Berry-au-Bac and Juvincourt, Hindenburg threw 30,000 of his best troops into the breach to stem the tide. Although this was the weakest point in the French line, the attackers were hurled back with terrible losses. The French so far had succeeded in straightening out the German salient, which had Fort Condé, on the Oise, for its tip.

The scene of the battle now centred around the Chemin des Dames (Ladies' Way), which was a beautiful shaded road running along the heights north of the Aisne. It had been specially constructed by Louis XV as a promenade for his daughters. The terrain of this part of the battle line was very peculiar. From the Aisne River, passing north to Craonne there is a limestone plateau, which is heavily wooded, and traversed by ravines and deep gullies, which were almost perfect concealments for machine gun emplacements. The limestone was honeycombed with caves and grottos, most of them natural, but some of them artificial, having been constructed by the Germans. In many cases the heavy French bombardment had no effect whatever on the German positions because they were so far underground.

On May 4, the French took Craonne village, which is about ten miles southeast of Laon and on the eastern end of the Chemin des Dames. On the next day they attacked on both ends of the Chemin des Dames, and took over 4000 prisoners. On both sides of the Soissons-Laon road (western end of Chemin des Dames), they carried a German salient on a four-mile front, extending their line from east of Vauxaillon to north of Sancy. On the eastern end of the Chemin des Dames, the French pushed forward

on the limestone plateau as far as Cerny-en-Laonnois, and took the hills which dominated the Ailette River valley. For the rest of the summer their line remained in approximately these positions. Almost in the centre of the heights north of the Aisne was the famous old fort of Malmaison. It had been officially abandoned as a fort by the French before the war broke out, but in the hands of the Germans it had been turned into an almost impregnable position. It was a mass of machine gun emplacements and had an intricate system of tunnels and caves connecting it with the German rear. French attempts to take it in April and May were futile, although an almost continual rain of steel had been poured on it. The German Crown Prince during the summer months is estimated to have lost over 100,000 men in unsuccessful efforts to regain the eastern and western ends of the Chemin des Dames. He made furious counter attacks on the newly won French positions and sought to take the initiative in the neighborhood of Soissons and Rheims, but all to no avail. Despite local German successes, the French lines held. They (the French) had also materially strengthened their positions around Rheims, which had been heavily bombarded throughout the campaign. Architects predicted that the famous cathedral at Rheims had been weakened to such an extent by the German artillery that it was in danger of falling to pieces at any moment.

After a lull of several months the final climax of the French offensive on the Aisne occurred in October. On the twenty-third of that month, the French executed one of the most brilliant offensives of the war. They struck on a six-mile front northeast of Soissons and advanced to an average depth of a mile and a half. The co-operation between the artillery, "tanks," *aéroplanes*, and infantry was a tribute to Gen. Pétain's careful preparation. The attack extended from Laffaux, near Vauxaillon, to the La Royère farm in the neighborhood of Fort Malmaison. The offensive was everywhere successful. All the German first line positions were seized and their hold on the Chemin des Dames was made untenable. Consequently, by November 1, they were compelled to give up the entire sector and retire across the Ailette River, which flows in front of Laon. In this last thrust the French regained nearly forty square miles of territory, took 12,000 prisoners, 200 guns, 700 machine guns, and 200 trench mortars, besides several thousand rifles and great stores of war material. The new French positions dominated the Aisne and Ailette valleys. They also opened up the possibilities of an offensive on Laon and the whole southern end of the "Hindenburg Line" as far north as La Fère.

(8) *Italian Spring Offensive (May-June)*

It will be remembered that in May, 1916, the Austrians began a great offensive against the Italian positions around the Lake of Garda and the Asiago plateau, with the idea of outflanking the Venetian plains. After an auspicious beginning, they were compelled to abandon this offensive because of the great Russian movement in Galicia. The Italians immediately recovered all the lost territory and started an offensive of their own on a grand scale. This ended at the beginning of winter after the capture of

## TRENCH SCENES ON THE FRENCH FRONT

Gorizia, Loguizza, and Jamiano, along with 39,000 prisoners. A strong foothold was made on the Carso plateau and they rested there with the idea of renewing the campaign in the spring.

The winter on the Italian front was much more severe than usual and of long duration. Despite adverse weather conditions, the activity behind the lines was feverish. The Italians spent their time in preparing to resist an offensive, which the Austrians were preparing in the Trentino and which had been discovered by the Italian air service. At the same time they were preparing with minute care a tremendous offensive on the southern part of their battle-line, which was supposed to conquer Trieste and Laibach, and thus destroy German naval power on the Adriatic and open up the way to Vienna. The plans as announced later by the Italian general staff were as follows: First, to engage the enemy on the entire front from Tolmino to the sea in an intense artillery action, which would leave him doubtful as to the real direction of the decisive attacks which were to be made; then to attack on the right wing of the southern army to the north of Gorizia; and, lastly, to strike on the Carso plateau.

The extreme lateness of the spring and the amount and care of the preparations prevented a beginning of operations until May. On the twelfth of that month, violent artillery fire broke out on the entire line from Tolmino to the sea. Two days later the infantry advanced and won initial successes on Monte Cucco and Monte Santo. Despite the intensity and driving power of the Italian blow, the Austrians on the entire front presented a stubborn and determined resistance. On the fifteenth the Italians crossed the Isonzo between Loga and Bodrez and also made gains on the two mountains mentioned above, as well as on the Vodice ridge. It took a week of desperate fighting before the Italians were able to consolidate these gains, but by the twenty-second they had a firm grip on the whole mountainous ridge which separates the valley of the Isonzo from the deep valley which branches out in front of Anzovo. The Italian war office announced that so far they had taken over 7000 prisoners.

The Austrians now made use of the preparations they had made during the winter months for an offensive movement, to create a diversion in the Trentino region. This consisted of a series of attacks which lasted from May 19 to May 22. Unsuccessful attacks were made in the Sugana valley, on the Asiago plateau, around Lake Garda, and in the Adige valley. This whole terrain was the scene of brilliant fighting during Napoleon's first Italian campaign. The most violent attack of all was repulsed by the Italians on May 22, after temporary Austrian successes in the Piccolo Colbricon and in the Travignolo valley. In this unsuccessful attempt to nullify and check the Italian offensive, the Austrians lost many men in killed, wounded, and captured.

On May 23, after intense artillery preparation, the Italian infantry began to advance again by attacking the southern edge of the Carso plateau, from Castagnavizza to the sea. Great fleets of airplanes flying low to the ground were of material aid to the infantry in this attack. Lucati, all of Jamiano, Bagni, and several important heights were captured. On the next day the advance was continued on a much wider front,

this time from the vicinity of Gorizia to the sea. Although the Italians gained ground it was only in the face of exceedingly stubborn resistance—counter attacks, violent artillery fire, and aerial bombardments from low flying aeroplanes. At the extreme southern end of the line huge British and Italian monitors, carrying naval guns of the largest type, did very effective work in bombarding the Austrian lines. In this phase of the battle the Italians captured 17,000 prisoners and were within eleven miles of their objective, Trieste.

On June 1, the Austrians, strengthened by great numbers of men and material brought from the Eastern Front as the result of the complete collapse of the Russian armies owing to the revolution, began an offensive on a large scale, which compelled the Italians to retire somewhat from their newly won positions. After three days of violent shelling they began an attack from Monte S. Marco to the sea. At the beginning it was successful. Italian positions on Monte S. Marco were taken and positions on Dosso Fauti were penetrated. South of Jamiano, the Italians were compelled to give up a strip of territory which they did not have time to consolidate. Gen. Cadorna, the commander-in-chief of the Italian armies, now began an offensive in the Trentino which compelled the Austrians to give up their offensive in the south. The spring campaign now came to a halt with the Italians securely entrenched on the edge of the Carso and holding most of the gains they had made. There is no doubt that the bitter fighting during May and June favored the Italian forces, although it is doubtful if they penetrated the Austrian lines as far as the general staff had hoped.

#### (9) *American Expeditionary Force* (June —)

After the declaration of war by the United States on Germany on April 6, public opinion in the United States and abroad wondered considerably what part the new member of the Allies would play in the world-wide war. The opinion at home and in the Allied countries seemed to be that not very much help on the battle fronts would be quickly forthcoming from the great republic on the Western Hemisphere. They looked for financial and economic aid rather than for manpower and gunpower. Before the declaration of war the American army consisted of less than 100,000 men, and experience on the continent had proved that it took from six to nine months to turn out an efficient soldier. In order to make the United States army an efficient fighting force, preparations on a gigantic scale were immediately entered upon. The State National Guard was called into Federal service, the regular army and marine corps recruited to full war strength, and the Selective Conscription Act passed. In Germany these preparations and the very entrance of the United States into the war was laughed at. The American army in comparison with the well-trained and seasoned German millions was an object of ridicule. Well-known German military experts put the effect of the United States' entrance into the war on a par with that of Rumania's. The feeling was widespread in Germany that even if the United States did raise and equip a big army, she would be unable to transport it to Europe and keep it supplied with materials

and provisions, because of the big inroads made on the shipping of the world by submarine activity.

The first contingent of an army from the United States of America to ever fight on European soil disembarked at a French port on June 26 and 27. Maj. Gen. William L. Sibert, who commanded this over-seas force, and his men, received a tremendous ovation. The town authorities had declared a holiday, and the khaki clad men marched to their barracks through lanes of men, women, and children, waving the American and French flags and shouting "Vivent les États Unis." The transports had several narrow escapes on their way over to France. They were twice unsuccessfully attacked by submarines, which were driven off by the convoying destroyers. Maj. Gen. John L. Pershing (who was later raised to the rank of full general by President Wilson), the commander-in-chief of the American Expeditionary Force, had been in France some time preparing for the coming of the "Sammies" as the French people nicknamed the American soldiers.

Training camps had been located in various parts of France and were ready for occupancy when the troops arrived. Infantry, artillery, cavalry, aviation, and medical bases were established. Besides these branches, special regiments were recruited in the United States and sent abroad as soon as possible. Some of the more numerous of the latter were engineers, railroad men, lumbermen, laborers, and aeroplane mechanics. The volunteer American ambulance drivers and the Lafayette Escadrille (an American flying squadron in the service of France) were taken over into United States service by Gen. Pershing. The number of troops going "over there" was gradually increased, many of them stopping in England before going to France. Although the total number of troops on foreign soil was never divulged by the War Department, Secretary Baker announced that the number being sent over exceeded the expectations and schedule of the authorities.

An intensive system of training, consisting of trench digging, bayonet fighting, bomb throwing, the use of gas masks, etc., was entered upon in July. The instructors were officers and men of the British and French armies, who had seen considerable service at the front. The American transport service took over all railways leading to the American bases and a section of a French national forest was turned over to American lumbermen to supply the needs of the expeditionary force.

The news that units of United States troops were in action "somewhere in France" was given out in a dispatch on October 27, 1917. This stated that American artillerymen had fired their first shot at the Germans and that American troops were in first line trenches. This active participation in the war did not mean that American forces had taken over a section of the front, but that they were completing their training under actual war conditions. American patrols a few nights later crept out into "No Man's Land" on reconnoitring expeditions. At stated intervals the troops in the trenches were changed so that as many of them as possible could be initiated into the real conditions of war. On November 3 the Berlin official report announced the capture of American troops, when an advance trench in which they were

located was cut off from the main trenches by a heavy barrage fire. Three Americans were killed, eleven missing, and about the same number injured. Although no official announcement has been made by the War Department as to the location of the American troops, outside of the bare statement that it was on a quiet sector of the front, a comparison of the various European reports show that the region was in the Vosges Mountains, where the Rhine-Marne Canal crosses the boundary line of France and Lorraine. During November and December, intermittent artillery duels and patrol engagements occurred but no conflict of any size developed. The unusual activity behind the German lines during the winter months was taken by Allied military experts as an indication that Germany was going to try to win the war by a supreme effort before the American army could be a vital factor. They also agreed that the entrance of the United States into the war on the side of the Allies more than neutralized the complete collapse of Russia.

#### (10) Messines Ridge (June)

After the defeat of the German thrust at Calais, called the battle of Ypres, in the early stages of the war, the position of the German and British lines was very peculiar. They resembled a huge S made backwards. Ypres was in the upper arc and Messines Ridge in the lower arc. The British line was really a great salient bulging into the German line. Messines Ridge in German hands was a serious menace to the entire British salient at Ypres as there was the ever present danger of an attack in force which would crush the southern side of the British defenses and as a result reopen the way to Calais. All the dominant artillery positions were in the hands of the Germans, and the manner in which the British had held on to the Ypres salient was almost miraculous.

The objects of the British attack on these positions in June were to straighten out the British lines south of Ypres and to get control of Messines Ridge which was about 250 feet high, the highest within a radius of 10 miles of this section of the front. General Sir Herbert C. O. Plumer was in direct charge of the operations. Very careful preparations were made to accomplish the above mentioned objects. For over 15 months British and colonial sappers had been digging under the low range of hills called Messines Ridge. They placed 19 mines, containing nearly 500 tons of ammonite, under the principal German fortifications, the forward positions of which consisted of elaborate systems of well wired trenches covering an area a mile wide. These were protected by artillery in the rear made up of all calibres and so located as to cover the flanks as well as the centre of an attack.

Early in the morning of June 7 the mines were set off by electric contact and a man-made earthquake, awesome and grawsome, occurred. The tops of the hills were blown off and the earth rocked like a ship rolling at sea. The roar of the explosion could be heard within a radius of 150 miles. Simultaneously with the explosion of the mines the artillery reached the height of intensity after a two weeks' preparation. The greater portion of the German first line trenches, dugouts, etc., were ob-

AMERICAN TROOPS MARCHING THROUGH A FRENCH VILLAGE

literated. Then the infantry, composed of English, Irish, Australian, and New Zealand units, swept forward on a front extending from Observation Ridge, south of Ypres, to Ploegsteert wood, north of Armentières, and within a few minutes captured the entire first line positions on a ten-mile front. These included the villages of Messines and Wytchaete. The latter town was called "White Sheet" by the British "Tom-mies."

Within three hours the entire top of the ridge had been cleared and later in the day the rear positions of the ridge were assaulted. These ran along the base of the ridge itself. The German defense here was stiffer than any yet encountered, but after fierce fighting the village of Oosttaverne and the entire defenses on a five-mile front and three miles deep were captured. During the progress of the battle the British artillery had been brought to the top of the ridge with the result that the Germans were compelled to abandon their lines between the Lys River and the village of St. Yves, with scarcely any infantry fighting. The British lines after this battle ran on a straight line from east of Zillebeke to a point east of Armentières. Seven thousand prisoners fell into British hands and the estimated German casualties were 30,000. The British lost in the neighborhood of 10,000 men.

#### (11) *Russian Summer Offensive (July)*

After the breakdown of the Russian Winter Offensive, aimed at Mitau, in January the entire Russian front was quiet until Kerensky came into power (see *RUSSIA, History*). As a result of his efforts, an offensive on a large scale was carried out by Gen. Brusilov under the personal direction of Kerensky. When the operations of the previous year ceased the battle line was on the eastern bank of the Zlota Lipa River from near Zloczow to Brzezany. It made a loop around this city, ran almost due south to the Dniester, which it crossed, and joined the Rumanian army on the boundary line of Transylvania and Rumania. The Russians determined to strike on this line with Lemberg as their objective. The Zlota Lipa is a rapid stream, flowing between steep banks, and one which would be very hard to cross by a frontal attack. Consequently, Kerensky and Gen. Brusilov decided to strike on the upper reaches of this river, where it was narrower and its banks less precipitous, and thus outflank the Austro-German positions.

On July 1 the Russians struck on a narrow front in the neighborhood of Zloczow. They took the village of Koniuchy and about 10,000 prisoners but were unable to break through the main positions of the enemy. The fighting was very heavy and the morale of the Russian army of the highest order. Brusilov's army surprised the world with the vigor of its assault and its seemingly limitless supply of ammunition. Not meeting with success in the vicinity of Zloczow, the attack was shifted to Brzezany, but here also the Russians were unable to pierce the hostile lines, which were defended by high ground in their rear.

After the failure of these attempts, the Russian command suddenly shifted the attack to south of the Dniester, driving due west in the neighborhood of Stanislaw. The strategy of this

blow was to strike the Austro-German lines where the forces of these two countries joined, and then drive a wedge in between them. It was strategy similar to this that made Napoleon's first Italian campaign a success. The weight of the onslaught broke the enemy lines and the Russian cavalry swept through the breach on a wide front. They crossed the Lukwa River, which was a strong defensive line, and seized the town of Kalucz, which they found unoccupied. This place is on the Lemberg-Stanislaw railroad and was formerly the Austrian army's headquarters. German forces, sent south to aid the Austrians, drove the Russians out of Kalucz, but after fierce fighting they securely reestablished themselves in the town. The Russians then pushed westward and crossed the Lomnica River, the last natural defense in front of Stryj. Simultaneously with this attack south of the Dniester, the Russians started a drive on the Dniester itself and took the important city of Halicz by storm. This place was the last stronghold south of Lemberg. The high tide of the Russian offensive was now reached, however. They had taken 50,000 prisoners and vast quantities of war material. A wedge 20 miles long and 10 miles deep had been driven into the Austro-German lines.

This drive turned out to be of no avail. Various sections of the Russian army mutinied, with the result that the entire army was compelled to withdraw. On July 19 the Germans began a counter movement and penetrated the Russian positions on a wide front near Zloczow. Russian trenches near Brzezany were occupied the next day owing to the mutiny of some extreme socialistic troops. The whole line in Galicia now began to retire. The Germans and their Austrian allies occupied Tarnopol, Stanislaw, Nadwaorna, Czernowitz, and Kolomea and drove the Russians across their own border and out of Galicia. Spasmodic attempts to take the offensive on the Rumanian front and in the north, to relieve the pressure in Galicia, were frustrated by mutiny among the troops.

#### (12) *British Reverse on the Yser (July)*

The Germans retaliated to some extent for the wiping out of the Messines Ridge salient on June 7, by making a successful attack on the northern extremity of the Allied line in Flanders. It was practically the only real offensive they carried out on the Western Front during the entire year. The British lines in this sector were very peculiar. The main British positions were west of the Yser River, with the centre of communications at Nieuport. The front line trenches, for a distance of about three miles from the coast, were about 600 yards east of the Yser. There was always considerable mystery as to why the British staff selected this line, inasmuch as when it was formed it was part of a defensive line, held during the German drive for Calais. All the supplies for the first line trenches had to be carried across the river, and there was the ever present danger of German artillery destroying the approaches, and thus catching the infantry between the river and enemy lines.

This is exactly what happened. The Germans, apparently without any knowledge or even suspicion on the part of the British, concentrated a mass of artillery on this front, and on July

11 began an artillery action of great intensity. The land here was very flat with the exception of an occasional sand dune, and the trenches were made of piled-up sandbags instead of being dug. These were immediately destroyed as were the approaches across the Yser River and canal. Then the German infantry rushed forward and killed or captured practically all the British troops east of the Yser. These probably numbered 3000 of which 1200 were taken prisoner. The military results were almost negligible. As the Germans had destroyed all the bridges they were not able to cross the river if they wanted to. On the other hand, it meant that if the British wanted to start an offensive up the Belgian coast they would have to cross the Yser River in the face of hostile artillery fire.

(13) *Italian Summer Campaign (July-October)*

When the Italian spring campaign came to a halt in June, the General Staff immediately began to make preparations on a large scale for the renewal of the operations against Laibach and Trieste. They were materially aided by the beginning of hostilities again on the Russian front (see section, *Russian Summer Offensive*, IV, 11). During July and August the opposing armies battled back and forth in an endeavor to get advantageous positions. The Italians advanced on the Carso and took Dalino, and repulsed strong Austrian attacks in force in the Trentino. The Austrians kept up a continual artillery bombardment in an attempt to break up the Italian preparations for an offensive. On the night of August 18 the Italian offensive began from Tolmino to the sea. The main attack was made by the Third Army, under Gen. Cappello, which operated on the Bainsizza plateau, Monte Santo, and Monte San Gabriele, and the Second Army, commanded by the Duke of Aosta, a cousin of the king, which operated in the Vipacco and Brestovizza valleys, and in front of the Hermada Mountains, which are the key to Trieste. The allied monitors and great numbers of aeroplanes again aided the advance.

One of the outstanding features of the Italian preparations was a great engineering feat carried out on the Isonzo River. The engineers had diverted the course of this river from its bed above Anovo and had built bridges across the shallow stream that remained. This work was done at night and at daybreak the water was redirected to its regular channel, without detection by the Austrians. By means of these bridges and hastily constructed pontoon bridges the Italians crossed the river on the 18th and gained a foothold on the northern edge of the Bainsizza plateau. Simultaneously with this action the right wing of Gen. Cappello's army began to envelop Monte Santo. These two movements compelled the Austrians to rapidly retire to the easternmost edge of the Bainsizza plateau. From the nature of the defenses it was quite apparent that the Austrian General Staff thought the plateau impregnable. Great quantities of prisoners, provisions, and military stores fell into the hands of the Italians. On August 24 the Italians occupied the summit of Monte Santo, 2240 feet high, and on September 14 Monte San Gabriele, 1700 feet above the

Isonzo, and 300 feet higher than Monte San Daniele. The Austrians still held the eastern slopes of Monte San Gabriele.

Operations in the south carried out by the Duke of Aosta's army proceeded favorably for the Italians, although much less rapidly than further north. His object was to surround the Hermada Mountains and to occupy the Vipacco Valley. Despite local successes, he was unable to accomplish these objects after strenuous efforts. During September and early October, the Second Army had succeeded in driving the Austrians from the slopes of Monte San Gabriele and in making slight gains on the Bainsizza and Carso plateaus. The Italian forces were resting up for another supreme effort to break through, when the sudden Austro-German drive at the northern extremity of their battle line compelled them to give up their entire gains of the year.

(14) *Battle of Flanders (July-December)*

The successful operations against the Messines Ridge in June and the deadlock in the Battle of Arras apparently caused the British General Staff to start an offensive in the Ypres section. As has been said above, Messines Ridge in German hands was a potent menace against the British flank, which was completely dominated by it. Messines Ridge in British hands enabled them to take the offensive instead of being continually on the defensive. Consequently, on July 31, the British and French began an offensive which lasted intermittently down to the beginning of 1918, when weather conditions called a halt. The immediate object of the offensive was to get control of the high ground in front of Ypres, called Passchendaele Ridge. The ultimate objectives of the offensive were to compel the Germans to retire from the Belgian coast and thus give up their submarine bases at Ostend and Zeebrugge, and also to envelop the industrial centre of Lille and the railway centre at Roulers. The entire country in this section is flat with the exception of Passchendaele Ridge. Heavy rains were frequent throughout the period of the fighting, which made the terrain a veritable sea of mud. Troops floundered along up to their knees in it, and artillery was moved only with the greatest difficulty. What trenches there were, were, in most cases, made of bags of sand piled one on top of the other.

For three weeks preceding the battle the artillery preparation had been stupendous. British guns of all calibres pounded the German lines and the Germans rushed up great masses of guns and men to meet the expected attack. The duel reached its greatest intensity on July 31, when, after a temporary lull, the British and French infantry struck on a 20-mile front from Dixmude to Warneton. The attacking troops carried everything before them, penetrating in some cases beyond the German third line trenches. On the next day a severe rainstorm, which lasted fifty hours, began and, perforce, held up further operations until the ground dried out sufficiently to make it passable. The next blow fell on August 10, when the British carried Westhoek village and ridge by storm and the French, on their left, took Bixchoote. On the 11th, the British occupied part of Glencourse wood. It is almost impossible to describe the

intensity and effectiveness of the British artillery fire accompanying these operations. They seemed to have an unlimited supply of ammunition stored up within very handy reach of the gunners. On one occasion an eye witness counted five distinct barrage fires moving accurately and methodically in advance of the British infantry. In the face of a fire like that, no man-made trench could remain in existence more than a moment. Partly as a result of necessity and partly as a new method of defense, the Germans developed the "pillboxes," as they were called by the British soldiers. These were concrete redoubts erected in shell holes. They were oftentimes some distance apart and were just about level with the ground, making them in many cases invisible to airmen. Machine guns fairly bristled all over

Germans from the salient between the Yser Canal and Martjevaart and captured the bridgehead at Dreigrachten. Torrential rains, with the resulting softening of the terrain, prevented further operations on a large scale for over a month.

When operations again became possible, the Allies delivered five extremely heavy blows between the middle of September and the middle of October, which drove a big wedge into the German positions. On September 20, an attack began on an eight-mile front between the Ypres-Comine Canal and the Ypres-Staden Railroad. This resulted in the capture of Glencourse Wood, Inverness Copse, Nonne Boshen, Gallipoli, Iberian Farm, and Potadam Vampire. All these places were named by the Allied troops stationed in front of them. In the centre Veldhoek and part

#### THE YPRES SALIENT

them, and, unless they were destroyed by artillery fire, they were hard problems for infantry to capture. Their great advantage lay in the fact that they did away with the necessity of keeping large quantities of troops in first line trenches where they were most likely to be a prey to the hostile artillery. As the Battle of Flanders progressed the "pillboxes" proved little more effective as a means of defense than the old trench system.

On August 16 the Allies struck again on a nine-mile front north and east of Ypres and carried practically all their objectives with the exception of the right wing, where British soldiers failed to capture the high ground almost due east of Ypres. The impetus of their first assault carried them up to it, but a furious counter attack drove them down again. In the centre the British captured the strongly fortified position of Langemark and advanced a mile beyond it. On the left the French drove the

of Polygon Wood were taken and consolidated. On September 26, while smashing on a six-mile front, one-half mile of the German positions were taken, which included Tower Hamlets Spur, the remainder of Polygon Wood and Zonnebeke.

On October 4 General Sir Douglas Haig struck again, this time on an eight-mile front from south of Tower Hamlets to the Ypres-Staden railroad, north of Langemark. The chief gain of this stroke was the seizure of Passchendaele Ridge as far as Broodseinde. It will be remembered that this ridge was the immediate objective of the Battle of Flanders. A fourth blow, struck on the 9th, gained St. Jean de Mangelaere and Poecappelle for the Allies. Following up his policy of not giving the enemy a chance to reform his lines, General Haig struck the fifth blow of the past month on the 12th. When this attack was halted because of unfavorable weather the British were within 500 yards of

the village of Passchendaele. These five blows recovered for the Allies an area of nearly 23 square miles and carried them to the Ypres-Roulers road on the northwest as well as an advance of a mile astride of the Ypres-Menin road. British artillery now dominated the Flanders plain and guns of the largest calibre could effectively shell Roulers, about five miles distant.

The battle was resumed on the 22nd, when the Allies advanced astride the Ypres-Staden railway. The French occupied the southern part of Houthoult Forest and several fortified farms, which were of stone and well supplied with machine guns. On the 28th the British advanced west of Passchendaele and the French seized Draehbank and several more farms. Part of the Belgian army, which had been thoroughly reorganized, with the aid of the French, captured the Mercken peninsula, formed by canals on three sides, south of Dixmude. They had to advance over two miles of swampy land to achieve this success. On the 30th the British entered Passchendaele, but were almost immediately driven out again by vigorous counter assaults. After a week of heavy bombardment the Canadians retook the town and German defenses 800 yards beyond, and held their gains in the face of furious counter attacks. The British spent the next week in consolidating their gains and in clearing the sides of Passchendaele Ridge.

The Battle of Flanders was now over for the remainder of 1917, excepting for strong "feelers" made by the Germans in the last week of December, when all the Allied nations were expecting them to deliver a heavy stroke somewhere along the Western Front. In summing up the battle, we find that the Allies had failed to drive the Germans from the Belgian coast and that they had failed to force them out of Lille. These were the two ultimate objectives of the battle. They had made important gains from the military point of view, however. They had wiped out the Ypres salient, which, at best, had been only a poor guarantee for the safety of Calais. They were able, from their new positions, to shell Roulers, an important railway junction, which supplied the submarine bases on the Belgian coast. They also hold positions which will ensure them a fair degree of success in an advance over the plains of Flanders in the spring of 1918, and in this way accomplish that which they failed to do in 1917. The Battle of Flanders also proved to the world that the Allies were dominant on the Western Front, and that they could practically take the offensive whenever they wished.

#### (15) Verdun Again (August-September)

After nine months of comparative quiet, quiet that had lasted since the hammerlike stroke of Pétain on December 15, 16, 17, and 18, 1916, the Verdun front came into the limelight again on August 20, 1917, when the French executed their most important offensive of the month. They started one of their quick thrusts with a brief artillery preparation and a comparatively small objective to be gained. On the above date, after a three-day bombardment, they advanced on both sides of the Meuse River and penetrated a mile and a quarter on an eleven-mile front. They captured Avocourt Wood,

Le Mort Homme, Corbeaux, and Cumières Woods, Côte de Talou, Chapneuville, Mormont Farm, Hill 240, and 4000 prisoners. In the next four days smashing blows were delivered which resulted in the capture of Regnéville, Samogneux, Côte de l'Oie and more than 15,000 prisoners. By September 15, the French had recovered more than 100 of the 120 square miles of territory, which the Germans, under the Crown Prince, had seized in their great, but unsuccessful, offensive. They now held all the dominating positions in the Verdun sector and strong German counterthrusts failed to dislodge their lines. They were also in a position to start an offensive from north of Nancy to St. Mihiel, with the fortified city of Metz as the objective.

#### (16) The Fall of Riga (September-October)

The important city of Riga was added to the list of German conquests in September, 1917. Despite the almost complete demoralization of the Russian armies the Germans were compelled to fight a series of severe engagements before they were able to capture the seaport and the islands guarding the mouth of its harbor. On August 15 Gen. Letchitsky was appointed commander-in-chief of the northern Russian armies to succeed Gen. Klemlovsky. The former reported after the capture of the city that the defenses south of the city were not in a bad condition, but that the artillery the Germans concentrated on this front was vastly superior in number and calibre to that of the Russians. The Germans also outnumbered the Russians in troops. They had close to a quarter of a million on the front from Riga to Friedrichstadt (45 miles), while the Russian forces were reduced to about 60,000 men. The Germans were also vastly superior in the matter of aeroplane service. This enabled them to fly low to the ground and to easily locate the Russian artillery positions.

On August 22 the Germans began an advance from Kemmern, which is between the Aa River and the Gulf of Riga. At the same time they drove the Russians back in the neighborhood of the Tirul marsh region and bombarded the Russian positions north of Dvinsk, on the right bank of the Dwina River. On September 2 they crossed this river at Uxkul, 16 miles southeast of the city of Riga. This enabled them to advance directly on the city along the Mitau-Riga roadway. Towards the end of the same day advanced units entered the city and Gen. Letchitsky withdrew to a prepared line east of the city. He was absolutely unable to even attempt to defend the city with the means at his command. The Germans continued to advance east of Riga. Their line had been extended about 50 miles and the Russians counter attacked and advanced where the German line was the thinnest. On September 21 the Germans renewed the offensive and struck on a 26-mile front, and penetrated to a depth of 6 miles. They captured the city of Jacobstadt, where they secured a vast amount of booty. The Russians counter attacked heavily but unsuccessfully. During the months of November and December the Germans withdrew from most of the area they had conquered after the fall of Riga, and sent a great number of troops to aid the Austrians in the

joint offensive against Italy (see *The Great Italian Retreat*, IV, 17). The kaiser in a speech to his Riga army highly complimented it on the glorious military victory it had gained.

From the strictly military point of view the capture of Riga was of no importance without the occupation of the islands which controlled the mouth of the Gulf of Riga. The overland route from Riga to Petrograd was over 300 miles and was too long a stretch for Germany's waning man power. On the other hand, the capture of Oesel, Dagö, and Moon islands would shorten the distance to Petrograd considerably and enable them to make a combined land and naval attack on the strong Russian naval base at Reval. They set out to accomplish this purpose in October. The reason they did not carry on their operations while advancing on Riga was apparently due to the mutiny in the German navy, reported in the Reichstag by Admiral Cappelle on October 9. On October 13 German forces were landed on Tagcalaket Bay, a northern inlet of Oesel Island, and at Serro on the southern end of Dagö Island. Advancing across Oesel Island, the Germans captured the capital and chief city of the island, Arensburg. The Russian garrisons on both islands were compelled to flee to the mainland to the eastward. In the meantime, the Russian Baltic fleet, which was aiding in the defense of the positions, was locked up in Moon Sound by a superior German fleet estimated to have consisted of fifty war vessels. The Russian battleship, *Slava*, 13,516 tons, and several smaller units were lost in the defense of the gulf. The Germans completely occupied the three islands—Oesel, Dagö, and Moon—and on October 21 occupied a position on the mainland, at Werder, but later voluntarily withdrew. In the meantime, the Russian fleet escaped after inflicting unknown losses on the German fleet (consult NAVAL PROGRESS). The great Austro-German offensive against Italy apparently made the German authorities decide not to make the expected drive for Reval and Petrograd. The latter city was extremely apprehensive of an attack and took preliminary steps to remove the seat of government to Moscow.

#### (17) *The Great Italian Retreat (October-December)*

Towards the close of 1917 we find the Germans putting into operation again the same policy of destroying one of her weaker enemies as she had done toward the close of 1915 and 1916. In 1915 it was Serbia, in 1916, Rumania, and in 1917, Italy. The position of the Italian armies was peculiarly vulnerable to the coup, which the Austrian and German high commands had worked out. The strategy was a repetition of that which caused the breakdown of the great Russian offensive at the Dunajec line in 1915.

As has been described above in the sections on the *Italian Spring Offensive* and *Italian Summer Campaign*, the main Italian army was striking on a comparatively narrow front on the Bainsizza Plateau. The entire line of active fighting was scarcely more than 12 or 15 miles long. The attacking force was composed of the flower of the Italian army and all seasoned veterans. The armies protecting its flanks were of unequal strength and were used for different purposes. Those on the upper Isonzo (First Army) and in the Trentino (Fourth Army)

were chiefly composed of territorials, i. e., older men who in peace times are held in reserve. There was only a mere sprinkling of seasoned men among them and they had not as yet actually participated in any very heavy fighting. The troops on the lower Isonzo were also veterans, and were pushing forward on the Carso and in the neighborhood of the Hermada Mountains toward Trieste, at the same time that the main army was hurling the Austrians back on the Bainsizza Plateau.

The success of the Italian campaigns had caused the Austrian high command to issue urgent call for help to Germany. The growth of the pacifistic Bolshevik movement in Russia, with consequent impairment of the efficiency of her armies, enabled Germany to bring about 100,000 men and a great quantity of heavy artillery to the aid of her weaker and sorely beset ally. The strategy of the campaign as marked out was sound. It was to strike at the unseasoned troops on the upper Isonzo, break through, and then cut the lines of communication of the Bainsizza and Carso armies, and thus cause their retirement by outflanking them. This task was made easier by the collapse of Russia, a superiority of artillery, the element of surprise, fraternizing of the Austrian and Italian troops, socialistic propaganda, and cowardice, which Gen. Cadorna claimed was exhibited by his troops on the upper Isonzo.

The campaign started when, on October 21, Austro-German batteries of heavy artillery bombarded the Plezzo (Flitsch)-Tolmino front and the northern edge of the Bainsizza Plateau. As the Italian guns were greatly outnumbered and outnumbered, the Austro-Germans with little difficulty broke through the Italian positions at Plezzo and Tolmino and crossed to the western bank of the Isonzo River. Converging from these points on Caporetto, the Germans opened the way for their outflanking movement by an advance down the Natisone and Judrio River valleys. This move threatened the rear of the second and third armies and compelled them to retire from their positions. The Austrian forces opposing them lost no opportunity to harass this retirement as much as possible. On the 27th, Berlin announced that the Teutonic Allies had captured so far 60,000 men and 500 guns. According to a report from Rome, most of these prisoners were non-combatants used in repairing roads back of the battle fronts. The cause of their capture was the seizure of Monte Matajur, which dominated the Italian rear down the valleys of the two rivers mentioned above. The rapid advance of the Germans and Austrians made the retreat from the Bainsizza and Carso plateaus across hastily constructed bridges over the Isonzo almost a rout. For a long time it looked as though the Italian commanders were going to be unable to extricate their menaced armies. On the 28th, Cividale was taken and thus railway communication with Udine, the seat of the Italian general headquarters. On the same day Gorizia was entered by the Austrians.

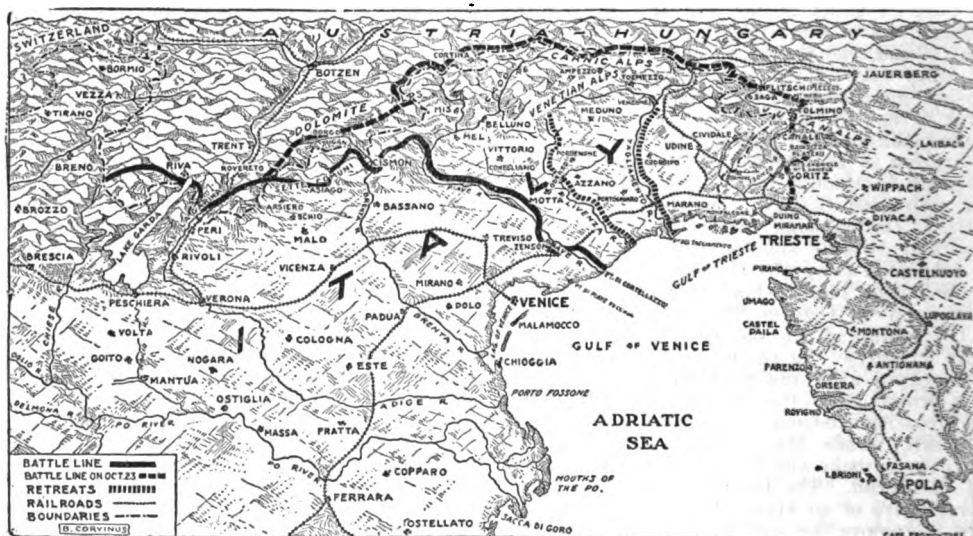

On October 30, Udine fell, and by the first of November Austro-German advance guards were on the Tagliamento River. This general retirement jeopardized the fourth Italian army, which was guarding the frontier in the Carnic Alps. They were compelled to abandon the mountain passes and beat a hasty retreat down the streams

running into the upper reaches of the Tagliamento and Piave rivers. The Italians, particularly the cavalry, fought valiant rearguard actions to stem the Teutonic hordes and hold the line of the Tagliamento. Berlin announced that up to the time they reached the Tagliamento they had captured 180,000 prisoners and 1500 guns.

The Tagliamento was only held temporarily, until the main Austro-German army arrived. They threw pontoon bridges across the river in scores of places and drove the Italians back to the Livenza, the next river flowing into the Gulf of Trieste parallel to the Tagliamento. Further German reports announced the capture of 250,000 prisoners and 2300 guns. The Livenza offered very little opportunities for resistance and was merely held to enable the completion of the defenses of the Piave River line, 10 to 20 miles further west. This had been a training place for recruits and was protected

the Venetian plains with comparatively slight loss to themselves. Several strong attempts were made to cross the lower Piave, some of which were successful, notably at Zenson. All of them were immediately driven back across the river, with the exception of the one at Zenson, which the Teutonic Allies hung on to tenaciously until the beginning of 1918, when a brilliant Italian infantry charge, supported by artillery fire, completely wiped out the foothold. The Austro-Germans were at a great disadvantage because they were unable to bring up their heavy artillery with any degree of rapidity on account of the systematic destruction of railroads by the retreating Italians. The Allied monitors, which had done such effective work in the attack on the Carso, were now used to shell the southern extremity of the enemy line and thus, in a measure, protect Venice. A large area between Venice and the mouth of the Piave was flooded to prevent any

MAP OF REGION OF NORTHERN ITALY INVADIED BY AUSTRO-GERMAN ARMIES. FORMER BATTLE FRONT SHOWN BY DOTTED LINE ON THE EAST; PRESENT FRONT BY BLACK LINE NORTH OF VENICE

by modern trenches and other fortifications. French and British infantry and heavy artillery, which were sorely needed, were arriving in ever-increasing numbers. A change was also made at this stage of the retreat in the Italian high command. Gen. Cadorna was removed and was appointed one of the members of the general staff, created by the Supreme War Council (see section *Allied Unity*, IV, 20). He was succeeded by Gen. Diaz, who was to be assisted by Gens. Badoglio and Giardino. Great preparations were also made to defend the line of the Adige River, still further west of the Piave. This was a very strong defensive line, extending from the mountains to the sea, and was almost incapable of a flanking movement such as had caused the abandonment of the Isonzo, Tagliamento, and Livenza River positions.

The line of the lower Piave held and the strategy of the Austro-German staff was to outflank it by seizing the Asiago Plateau and the line of hills between the Piave and Brenta rivers. This would enable them to debouch onto

crossing of the river near the famous old city. This was done by diverting part of the waters of the Piave to an old channel, which had been closed up to keep the lagoons and canals of the city from rising too high.

Finding all efforts to force a crossing of the lower Piave futile, the Austro-German armies now concentrated all their efforts on outflanking the lower Piave by striking at the Asiago Plateau, the weakest point of the Italian line. In order to select the strongest defensible line possible the Italians withdrew from the region around the northern end of Lake Garda to the upper reaches of the Piave. They grimly held on to Monte Tomba and Monte Monferiera, which stand like sentinels, guarding the passes to the plains between the Brenta and Piave River valleys. Great masses of Austrians and Germans were hurled at the Italian positions but their rock trenches held firmly. These attacks are comparable to those made by the crown prince during the great drive on Verdun of last year and his efforts on the Chemin des

Dames of this year. The immediate objective of the Central Powers was the line of hills which stretch across the plain between the upper Brenta and Piave. For more than three weeks this mountain range was bitterly contested for. Continuous artillery duels followed by infantry attacks by both sides were of daily occurrence. Although the Italians were forced to give ground their main line held and the Teutonic attempt to reach the Venetian plains in this direction was for the time being foiled.

The first week in December saw a shift in the attack to a point further west. This time the Austro-German forces, under the leadership of Field Marshal von Hoetzendorf, struck between the Brenta and Astico rivers on a four-mile front from Ronchi Valley to Monte Kabalaba. This is approximately the pivot of the Italian retreat, i. e., where the new line was anchored onto the old one. The German attack found the Italians poorly prepared to meet it. They were just about to retire to more easily defended positions. From the 5th to the 8th the Germans took an additional 15,000 prisoners, but, strange to say, hurled the Italians back to more easily defended positions. The former line had been an inverted U-shape and now the bulge was driven in and the line made straight. Here again we find a low line of hills, similar to that between the Brenta and Piave, guarding the way to the plains. The Germans hurled great masses of troops against these positions and gradually stormed them, one by one, forcing the Italians ever nearer to a precipitous rout. On December 15 Col Caprille was stormed and 3000 prisoners taken. On December 19 they also stormed Monte Asolone and took 2000 more prisoners. The Austro-German forces were now within four miles of the Venetian plains and the Italian armies on the whole Piave line were in a very precarious situation. Apparently imbued with the knowledge that further enemy successes would imperil their whole country, desperate Italian counter attacks regained the lost positions on Monte Asolone.

In the last week of the year a fresh attempt was made by the Teutonic Allies to break through. A particularly open winter permitted operations long after they would normally have to cease on account of heavy falls of snow. This time they struck at Col del Rosso and Monte Valbella, which guard the head of the Frenzela Valley, which connects with the Brenta Valley. They are in the neighborhood of Monte Sisemol, which had been the scene of a bitter struggle the week previous. Berlin announced the capture of these two heights and 9000 prisoners. The same week saw the use of Allied forces, when the French made important gains on the slopes of Monte Tomba.

As the year 1917 closed, the battle of the Piave was still in doubt. Military experts seemed to agree that the holding of the line was only temporary and that before the winter finally set in or, at least by early spring, the Italian defenders would be compelled to retire to the Adige. A compilation of German reports showed that they had taken nearly 300,000 prisoners and 2700 guns. Besides they had occupied 4000 square miles of Italian territory and were threatening the richest section of Italy, and the very backbone of the munition manufacturing district. The Italian retreat coupled with the complete collapse of Russia made the year a very disastrous one for the Entente Al-

lies. These two things more than offset the gains on the Western Front, the victories in Asia Minor, and the entrance of the United States into the war. Italy is now a liability rather than an asset. She has lost over half of her artillery and at least half of her military stores. France and Great Britain were compelled to detach two armies from the Western Front and send them to the aid of their weaker and almost prostrate ally. The Italian defeat was also used by the Germans as a strong basis for their winter peace negotiations. Consult the *Diplomacy of the War* section of this article.

#### (18) Palestine Campaign (October—)

After several Turkish threats at the Suez Canal and Egypt had come within an ace of succeeding, the British high command determined to take the offensive in that region, and remove, if possible, the danger of further threats. This plan was put into execution at the beginning of 1917, when the British began an advance on Rafa, on the Sinai Peninsula, in January. After bitter fighting this town fell in the early part of February and the British began a slow advance toward Gaza and Beersheba. Their efforts to reach these towns were unsuccessful, and after a severe reverse they were compelled to spend the hot summer months on the Gaza River. When operations again became possible, they began to advance (October) and by the end of the year had won a series of brilliant successes. The offensive was under the command of General Allenby. On October 31 Beersheba was taken in a surprise attack and on November 6 Gaza, near the coast, was captured. Continuing his advance northward, with comparatively little opposition, General Allenby cut the Jaffa-Jerusalem railroad at Ludd and El Ramle, by the middle of November. He followed up this success a few days later by capturing Jaffa, the seaport of Jerusalem. The British now began a movement to encircle the city of Jerusalem in order to cut off its supplies, so that it would not have to undergo what might prove to be an irreparable destructive bombardment. To accomplish this purpose he moved down the Surar River valley and up the Damascus-Beersheba railroad from the point where it intersected the Jaffa-Jerusalem line. All the Turkish positions around the Holy City were taken by storm and as the British closed in it became apparent that the Turks would not risk a siege. The city fell on December 10 and there was general rejoicing throughout the world over its return to Christian hands after being held by the Turks for almost seven centuries. The Turkish forces west and northwest of the city carried on a destructive guerilla warfare until the British got control of all the high ground. General Allenby immediately began to strengthen his position in the vicinity of the Jaffa-Jerusalem railroad by crossing a small stream four miles north of Jaffa and getting control of all the high ground in the neighborhood. Increased activities during the latter part of December presaged a renewal of the drive northward.

The success of British arms in Palestine revived the hopes of the Zionists (see article *JEWS AND JUDAISM*), who dreamed of a reestablishment of the Jewish nation in Palestine. The British Government announced on several occa-

sions that it looked with favor on the Zionist movement.

(19) *Battle of Cambrai (November-December)*

On November 21 the British started a drive for Cambrai, which for a time threatened to smash the famous "Hindenburg Line" and possibly put an end to the deadlock on the Western Front. After great initial British successes, the Germans started a counter offensive, which almost nullified the British gains. The method of beginning the battle in the immediate neighborhood of Cambrai was unique in the annals of the war. It was made with scarcely any artillery preparation, and its success was due to the great element of surprise. Heretofore great offensive movements had only been made after intense artillery preparation, which has the decided disadvantage to the attacker of letting the enemy know where the blow is about to fall. The attack was made on a 35-mile front from St. Quentin to the Scarpe River, although the chief operations were due west of Cambrai. Huge "tanks" (a British estimate places the number at 500), screened by smoke, plunged through the German barb wire defenses as though they did not exist. Gen. Sir Julian H. G. Byng was in direct charge of the operations. The first day saw an advance of five miles and the capture of 8000 prisoners.

THE BATTLE OF CAMBRAI

The villages of Benvais, La Vacquerie, Ribecourt, Havrincourt, Marcoing, Gouzeaucourt, Graincourt, Anneux, and Noyelles-sur-l'Escaut were captured as well as several fortified farms and forests. Part of Bourlon Wood, the dominating height around Cambrai, and a part of Bullecourt were also taken. Fontaine Notre Dame, three-quarters of a mile from Cambrai, was seized, but was retaken by the Germans on the next day in a fierce counter attack. For the first time since the withdrawal of the Germans after the Battle of the Somme, open fighting, in which the cavalry and "tanks" played a large part, prevailed on the Western Front.

Two days later the British renewed their drive and a bitter struggle ensued near Moeu-

vres, south of Bourlon Wood, and at Crevecoeur, south of Cambrai. The British took a hill dominating the former position, and as a result of the two days' fighting the German grip on Cambrai and Queant was made precarious. Bourlon Wood and village changed hands several times, the British finally being compelled to relinquish the latter after they were almost completely encircled by German troops. Cambrai must have suffered severely as a result of the British shelling from Bourlon Wood.

On the last day of November the Germans began a counter offensive against the newly won British positions. The latter had scarcely had time to consolidate them properly. The Germans struck on a 16-mile front north, south, and east of the British wedge. Their object was to flatten the tip of the salient and at the same time crush one or both sides of it and consequently cause a withdrawal. On the north and east they failed to gain, but on the south they entered La Vacquerie and Gouzeaucourt, which had been taken by the British on the first day of their drive. After failing in nine attempts, the Germans seized Masnières in the tenth. Up to December 4 the Germans claimed to have taken 100 guns and 6000 prisoners. The British War Office admitted the loss of the guns, claiming that they were the only ones captured from the British during the entire year.

The success of the German thrust at the south side of the wedge compelled the British to rectify their lines on the eastern side of it. Consequently they withdrew from Bourlon Wood and abandoned Noyelles-sur-l'Escaut, Anneux, Cantain, Graincourt, and Marcoing. They had been forced to give up about half of the territory taken in the drive. American engineers, who were working behind the British lines, were caught between the hostile forces when the Germans broke through the British positions. They seized rifles from fallen British soldiers and fought valiantly against the Germans, being especially mentioned by General Haig in his report. Several of them lost their lives. The Germans made a furious attack on December 13, between Bullecourt and Queant, but were unable to break through the British positions. Artillery duels, followed in some cases by infantry attacks, marked the Cambrai front for the remainder of the year. Despite local successes the Germans were unable to penetrate the British lines.

(20) *Allied Unity (November-December)*

On November 9 there was a conference held at Rapallo, Italy, the results of which are bound to have a marked effect on the outcome of the war. Those present were Lloyd George, the British Premier; Painlevé, the French Premier; Orlando, the Italian Premier; Lieut. Gen. Sir William Robertson, Chief of the British Imperial Staff; Maj. Gen. Sir Henry H. Wilson; Gen. Smuts; Sonnino, the Italian Foreign Minister; Henry Franklin-Bouillon, the French Minister of Missions Abroad; and Gen. Foch, Chief of Staff of the French War Ministry.

The chief result of this gathering of notables was the creation of a Supreme War Council, the purposes and aims of which are probably best summed up in the first two paragraphs of the agreement signed by the three powers: "With

#### AMERICAN COMMISSION TO THE ALLIED WAR CONFERENCE AT PARIS.

Sitting, left to right: Bainbridge Colby, U. S. Shipping Board; Admiral W. S. Benson, Chief of Naval Operations; Colonel E. M. House, the President's confidential adviser; General Tasker H. Bliss, Chief of Staff, United States Army; Oscar T. Crosby, Assistant Secretary of the Treasury. Other members included Vance C. McCormick, Chairman of the War Trade Board; Dr. Alonzo E. Taylor, representing the Food Controller; and Thomas Nelson Perkins, representing the Priority Board.

a view to better coördination of the military action on the Western Front, a Supreme War Council is composed of the prime minister and a member of the government of each of the great powers whose armies are fighting on that front, the extension of the scope of the council to other fronts to be reserved for discussion with the other great powers. The Supreme War Council has for its mission to watch over the general conduct of the war. It prepares recommendations for the consideration of the governments and keeps itself informed of their execution and reports thereon to the respective governments." The first act of the war council was the appointment of an inter-Allied general staff, composed of Gen. Cadorna, representing Italy, Gen. Foch, France, and Gen. Wilson, Great Britain.

In a speech in Paris on November 12, Lloyd George, with brutal frankness, told the reasons for the adoption of the "Rapallo plan," as it was called. He said in part: "... The Italian disaster necessitated action without delay to repair it. ... It is true we sent troops to Saloniki to succor Serbia, but as always they were sent too late. Half the men who fell in the vain effort to pierce the Western Front in September that same year would have saved Serbia, saved the Balkans, and completed the blockade of Germany. ... 1915 was the year of the Serbian tragedy; 1916 was the year of the Rumanian tragedy, which was a repetition of the Serbian story almost without change. ... National and professional traditions, questions of prestige and susceptibilities, all conspired to render our best decisions vain. ... The war has been prolonged by particularism. It will be shortened by solidarity." Premier Painlevé said at the same time, "A single front, a single army, a single nation—that is the programme requisite for future victory."

Lloyd George's speech caused considerable comment throughout England, the chief criticism of it being that it was an attempt to bring military affairs under the control of politicians.

On November 7, Secretary of State Lansing announced the personnel of an American commission which had just landed in London, whose purpose was to hold conferences with the Allies in order to bring about "a more complete co-ordination of the activities of the various nations engaged in the conflict and a more comprehensive understanding of their respective needs, in order that the joint efforts of the co-belligerents may attain the highest war efficiency." The members of the commission were Col. E. M. House, chairman; Admiral Benson; Gen. Bliss; Assistant Secretary of the Treasury Crosby; Vance C. McCormick, chairman of the War Trade Board; Bainbridge Colby, of the Shipping Board; Dr. Alonzo E. Taylor, of the Food Administration; and Thomas Nelson Perkins, of the Priority Board. On November 18, President Wilson cabled to Col. House that the United States government considered "unity of plan and control" absolutely essential. He also instructed Col. House and Gen. Bliss to represent the United States at the first meeting of the Supreme War Council, which meant that the United States government approved of the "Rapallo plan." The commission returned in December, but the nature or results of its work were not made public until the close of the year, when the recommendations of the commission were published by Secretary

of State Lansing. They recommended "that the United States exert all their influence to secure entire unity of effort, military, naval, and economic, between themselves and the countries associated with them in the war." "That the fighting forces of the United States be despatched to Europe with the least possible delay incident to training and equipment." The commission also urged the hastening and extension of the United States shipping plan, by a systematic coördination of resources of men and material.

On December 4 the French foreign office announced that the Supreme War Council had determined to create an Inter-Allied Naval Board whose duties would be similar to those of the Inter-Allied General Staff.

#### (21) *Completion of Conquest of German East Africa (December)*

When the year 1916 closed, the Allied forces operating in German East Africa had forced the German and native troops back from the coast into the mountainous region south of the great central railroad running from Dar-es-Salaam to Ujiji. During the year 1917 the Allies concentrated their efforts in annihilating the opposing army, which had broken up into several groups who were carrying on a guerilla warfare. They gradually forced them back toward Utete and Utembe Lake, and began a systematic encircling movement. The German forces were unable to get any supplies, as the British controlled the entire coastline, and consequently were not in a position to offer much resistance. On December 3 the British War Office announced that German East Africa had been completely cleared of the enemy. Every German colony was now entirely occupied by Allied forces.

#### (22) *Complete Collapse of Russia's Armies*

The outstanding feature of the year was the complete collapse of the Russian armies with the consequent elimination of Russia as a vital factor in the war. During the first two years and a half of the conflict the Russian armies had played a tremendous part in lessening Teutonic pressure on other fronts. They had proved as a fighting force that they were considerably superior to the Austrian armies, although they were almost invariably outfought by the Germans. The courage and morale shown by the Russian soldier is all the more to be wondered at when one considers the Germanophile and bureaucratic politicians who were in charge of the government.

With the coming of the revolution, there spread all over Russia a strong undercurrent of pacifism and desire for peace, which gradually undermined the fighting forces of the nation. Throughout the revolution we find the Council of Soldiers' and Workmen's Delegates playing the leading rôle. Even when the governments of Lvoff, Miliukoff, and Kerensky were exercising their greatest powers, this council was announcing to the country that it was the real leader of the revolution, and the safeguarding of its principles against reactionary movements was in its hands. As a result of this assumption of prerogatives, the military discipline, necessary to the successful operations of armies, was swept away. The council took upon itself

the sanctioning of all rules and regulations passed by the revolutionary government, concerning the army. Ministers of war resigned because they were unable to efficiently carry out their duties, owing to interference by the council. Commanders-in-chief resigned for the same reason. The death penalty was done away with for military offenses and the soldiers had to approve the orders of their officers before they were carried out.

Socialistic and pacifistic literature was spread broadcast among the soldiers and they were told that the *ancien régime* had made imperialistic treaties with other members of the Entente Allies. Fraternizing and exchange of goods were common occurrences on the entire eastern front throughout the entire year. Owing to Kerensky's personal magnetism, discipline and some semblance of order were restored to the ranks temporarily. It was during this period that the July offensive was carried out by Gen. Brusilov. As has been related above this completely broke down and ended in a rout because of the widespread mutiny among extremely socialistic troops.

When the Bolsheviki came into power (see *Russia, History*), all fighting ceased. The Maximalist party was apparently opposed to war and favored an immediate negotiated peace. They began to demobilize the army, and in December ordered all munition factories to stop the manufacture of war material. Desertions occurred in wholesale quantities and were not followed up by arrest and punishment. During the same month an armistice was signed between the Russian and Rumanian governments and those of the Teutonic Allies.

The collapse of Russia's armies put a double burden on the armies of her other Allies and enabled Germany to withdraw vast quantities of men and material from the Russian front for use on other fronts. The entrance of the United States into the war, in a measure, offset the practical dropping out of Russia.

#### (23) Macedonian Front

The year 1917 was one of comparative inactivity on the Macedonian front and January 1, 1918, finds the situation there almost exactly the same as on January 1, 1917. The failure of Gen. Sarrail's army to create a diversion to relieve the pressure on Rumania was in a large measure due to the fear of an attack in his rear by Constantine, the pro-German king of Greece. The possibility of the Macedonian Expeditionary Force accomplishing anything worth while was completely destroyed by the total downfall of Russia. His force was not strong enough to meet the combined strength of the now unhampered Bulgarian, Turkish, Austrian, and German forces opposed to him. Up to June spasmodic fighting, generally successful to the Allies, occurred in Albania, where the Italians occupied Cerevoda, Velisest, Osaja, and Cafa (May 31), in the Lake Doiran region, where the British took two miles of Bulgar trenches and several villages, which they were compelled to evacuate later, and in Thessaly, where the French occupied several towns.

The situation in the Balkans was considerably cleared up by the abdication of the King of Greece on June 12 (see *Diplomacy of the War* section of this article and the separate article on *GREECE*). The ever present threat of an at-

tack in the rear of the Allied army in Macedonia was now removed and the way cleared for a possible advance. The advance could be up the valley of the Tckerna, Vardar, or Struma rivers, with the city of Nish as an objective. This advance was not undertaken, possibly because, as has been suggested above, of the complete collapse of the Russian army, which, perforce, meant the complete collapse of the Rumanian army. Indications of a general readjustment of the Macedonian front were numerous at the close of 1917. Gen. Sarrail was removed as commander-in-chief and the entire front has been comparatively inactive from June to December. Just what changes are to be made on this front have never been divulged, but the most logical one is that it will be abandoned as the scene of a possible offensive. If so, a force just sufficient to hold the Teutonic Allies there in check will be maintained, and thus relieve about 750,000 men for operations elsewhere, possibly in Asia Minor. Part of the defensive army will be made up of the Greek army (about 300,000 men), which has been well trained and equipped since Greece entered the war.

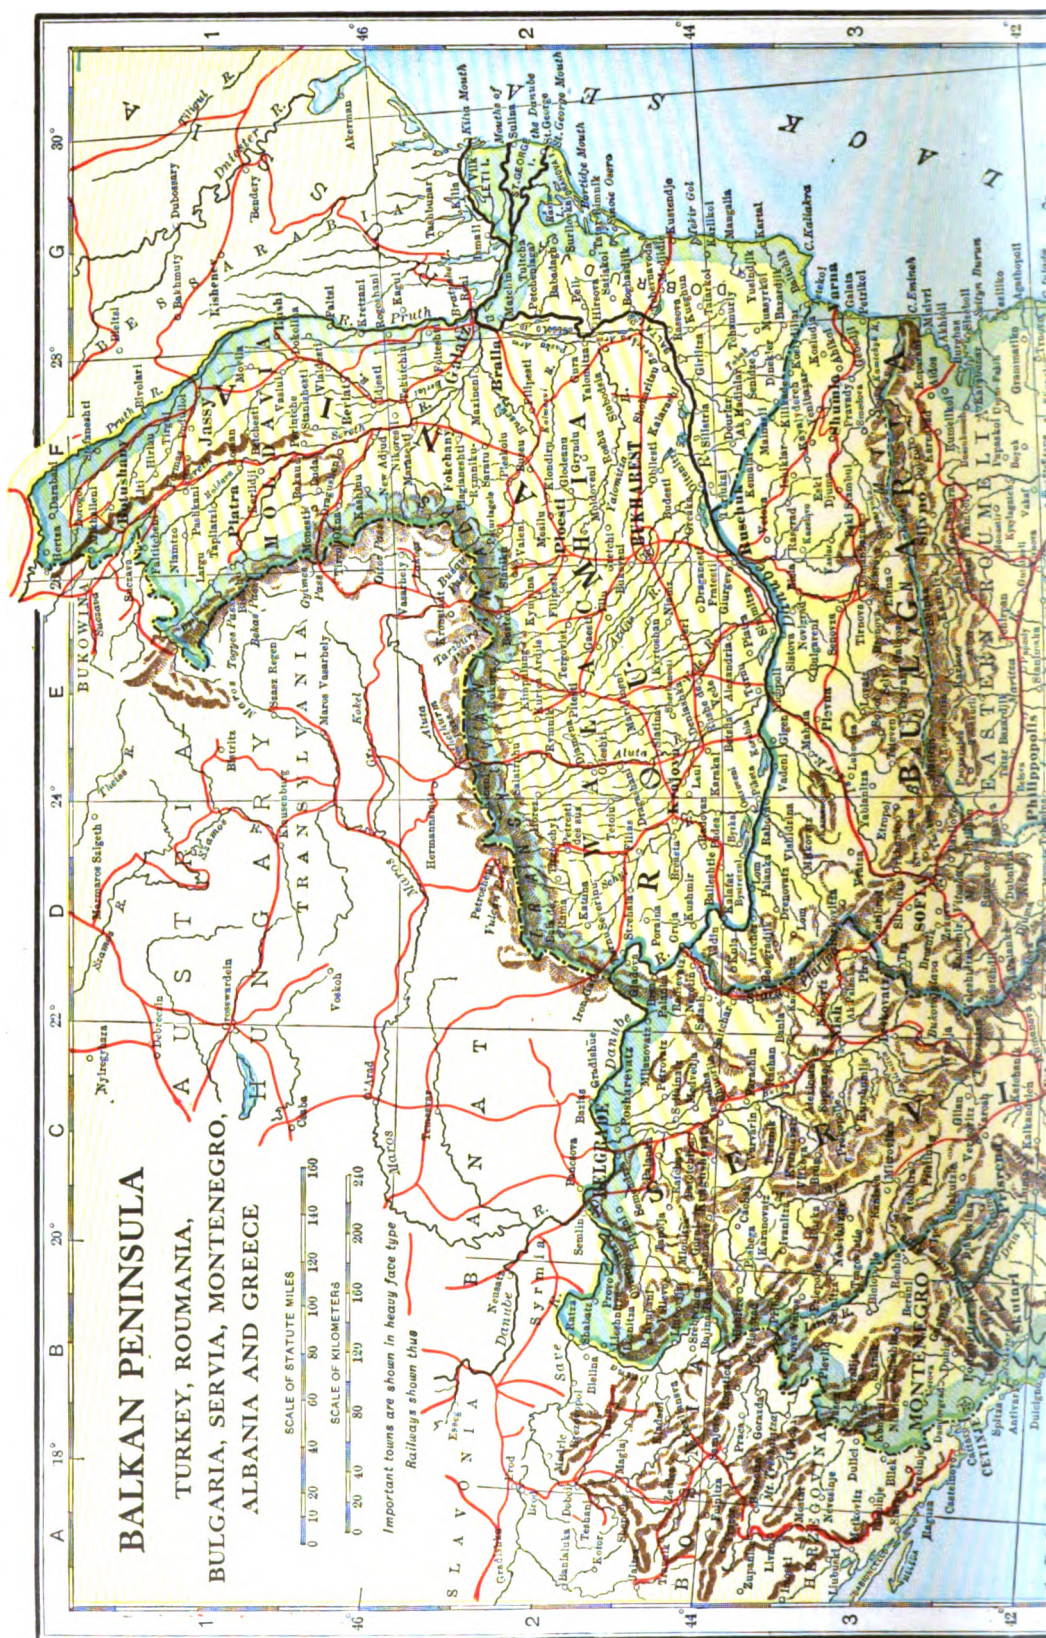

#### (24) Estimated Participants and Casualties

On October 22, 1917, the United States' War Department issued a statement concerning the number of men bearing arms in the great war. The figures are in round numbers and cannot be considered as entirely accurate. They are based on published reports from the various nations engaged in the war and do not include the men enlisted in the navies of the belligerents. According to the War Department's estimate there were at that time 38,000,000 men actually bearing arms. The estimates are as follows: Teutonic allies: Germany, 7,000,000; Austria, 3,000,000; Turkey, 300,000; Bulgaria, 300,000; Entente Allies: Russia, 9,000,000; France, 6,000,000; Great Britain (including colonies), 5,000,000; Italy, 3,000,000; Japan, 1,400,000; United States, over 1,000,000; China, 541,000; Rumania, 320,000; Serbia, 300,000; Belgium, 300,000; Greece, 300,000; Portugal, 200,000; Montenegro, 40,000; Siam, 36,000; Cuba, 11,000; Liberia, 400. To these figures should be added the army of Brazil, which declared war shortly after the above estimate was made. The standing army of Brazil is 32,000 in peace times.

Figures pertaining to casualties are at best untrustworthy. There are so many classifications of casualties that it is hard to actually tell how many men have been actually killed, wounded, and captured. For example, one man might be slightly wounded three or four times in the course of the year and consequently appear on the wounded list four times. The following figures are taken from a New York City daily paper and may be considered fairly accurate, as they were compiled from official lists. The total number of men killed, captured, or permanently incapacitated for fighting, from the beginning of the war to January, 1918, amounted to 15,099,000. While these figures are considerably smaller than those published in the 1918 YEAR BOOK, it must be remembered that they do not include those who were wounded and later able to return to the firing line. The total was roughly proportioned among the belligerents as follows: Teutonic Allies: Ger-

many, 4,550,000; Austria, 2,000,000; Turkey, 350,000; Bulgaria, 24,000. Entente Allies: Russia, 4,500,000; France, 2,000,000; Great Britain, 705,000; Rumania, 350,000; Italy, 250,000; Belgium, 120,000; Serbia, 100,000; Montenegro, 30,000.

## V. NAVAL OPERATIONS

### *Battles in Gulf of Riga (October)*

The chief naval engagement of the year occurred between the Russian and German Baltic fleets during the occupation of Oesel, Dagö, and Moon islands in October. A description of these naval battles is given under the article **NAVAL PROGRESS**.

### *Minor Naval Losses and Operations*

The year 1917 was comparatively quiet on the sea as far as the navies of the belligerents were concerned. No naval engagement of any size developed besides those mentioned above, although there were several minor operations carried on and almost all the countries suffered some slight losses. On January 23 a battle between destroyers occurred in the North Sea, in which Berlin claimed two British destroyers were sunk. London admitted the loss of one vessel. German war vessels carried out several raids on the east coast of England and the coast of France, which caused practically no military damage. Broadstairs and Margate were shelled on February 26, after which the attackers got away unscathed. In April Ramsgate, Calais, and Dunkirk were bombarded. On September 5 Scarborough was bombarded, but not seriously damaged, by a submarine.

On April 8, near the Belgian coast, the Germans lost one destroyer and had another seriously damaged. On the 21st of the same month two German destroyers and two smaller British craft were sunk near Dover. In the early part of June the British sank the S-20 and damaged another destroyer. A few days later, both Germany and Great Britain lost a destroyer in the North Sea, due to the explosion of mines. On October 2, the British cruiser *Drake*, 14,000 tons, was torpedoed and sunk off the northern coast of Ireland. On October 17, two German raiding cruisers attacked a convoy in the North Sea and sank 5 Norwegian vessels, 3 Swedish, 1 Danish, and the British destroyers, *Mary Rose* and *Strongbow*.

On November 3 the British sank the German auxiliary cruiser *Marie of Flensburg*, and ten patrol boats in the Cattegat. On the same day they destroyed a crewless raider off the Belgian coast. This is a vessel loaded with high explosives, which will go off on contact. It is electrically controlled, run by gas engines, and is supposed to be steered into hostile warships. On November 21 a skirmish occurred between German and British light forces in which neither side did much damage. The British pursued the Germans to within thirty miles of the Heligoland Bight. On December 17 German cruisers again raided a convoy in the North Sea and sank 11 ships, including the British destroyer *Partridge*.

In the Adriatic the Allies developed two new and distinctive types of fighting craft. One was an extremely large monitor, carrying the heaviest of naval guns. It was usually towed

into position, as it had no motive power of its own. These monitors did particularly effective work during the attack on the Carso and the defense of Venice. The other was a light motor boat, equipped with torpedo tubes. These boats were very fast and of light draft, being designed to sail over the mine fields of Trieste and Pola. In December some of them entered the former harbor and torpedoed two cruisers of the *Wien* type.

The entrance of the United States into the war was almost immediately followed by the active participation of her navy. She took over the patrolling of the Atlantic waters, and in May it was announced that a flotilla of American destroyers was actively engaged in European waters in combating the submarine menace. On October 17 the American transport *Antilles* was sunk on a return trip from France, with a loss of seventy lives. On November 1 another American transport, the *Finland*, was torpedoed, but was able to return to the French port she had just left. On November 5 the *Alcedo*, an American patrol boat in European waters, was sunk with a loss of 21 lives. On the 19th of the same month the American destroyer *Chauncey* was sunk in a collision and 21 lives were lost. On December 6 one of the newest American destroyers, the *Jacob Jones*, was torpedoed and sunk and over 60 men lost their lives.

### *Submarines and Commerce Raiders*

The practical deadlock that existed on the Western Front at the close of the campaigns of 1916 apparently made Germany realize that her desire for victory could not be consummated on the battlefield. Her defeat at the Battle of the Marne and the costly and unsuccessful attempt of the crown prince at Verdun evidently convinced the rulers of Germany that the slogan of the French, "They Shall Not Pass," was an actual reality. They therefore determined to risk everything on a ruthless submarine warfare in order to bring the Allies to their knees. Casting aside all regard for international law and the rights and feelings of neutrals, Germany issued on January 31 a note which prescribed that with certain definite limitations an unrestricted warfare would be waged against all vessels. We know now that the German rulers considered and waived aside the possibility of the United States (the country which would be most affected) entering the war on the side of the Allies. For the contents of the note and its effect on the American people consult the article **UNITED STATES AND THE WAR**.

Up to the time of the beginning of the intensive warfare, the amount of tonnage sunk during the war varied according to British and German claims. The latter claimed that 4,400,000 tons, of which 3,000,000 were British, had been sunk up to February 1, 1917. The British Admiralty estimate was slightly more than 3,000,000 tons, including all losses. In the first month of the warfare Berlin claimed to have sunk 368 vessels of 781,000 tons. These figures varied widely from those given out at London, which claimed that only 490,000 tons had been sunk. To quote from President Wilson's war message, "Vessels of every kind, whatever their flag, their character, their cargo, their destination, their errand, have been ruthlessly sent to the bottom without warning and with-

out thought of help or mercy for those on board, the vessels of friendly neutrals along with those of belligerents. Even hospital ships and ships carrying relief to the sorely bereaved and stricken people of Belgium, though the latter were provided with a safe conduct through the prescribed areas by the German government itself and were distinguished by unmistakable marks of identity, have been sunk with the same reckless lack of compassion or principle."

Starting with March, the admiralties of the Allied countries began to report the sinkings in a general way, so that it is impossible to gain facts as to tonnage destroyed and vessels sunk. They made weekly reports of the number of vessels over 1600 tons and the number of vessels under 1600 tons sunk. The weekly and monthly losses fluctuated considerably. April, June, and December were high months, while July, August, and September were low months. A conservative estimate of the total tonnage lost during the year would be 6,500,000. No figures are available for the losses of submarines.

The methods of fighting the submarines were many and varied. Small, speedy patrol boats, mounting light guns, the arming of merchantmen, aéroplanes, destroyers, depth bombs, smoke screens, nets, and convoys may be mentioned as some of the more common means of combating the submarine. The use of the indirect method of destroying its effectiveness, by building shipping faster than it could be destroyed, is evidenced by the remarkably rapid increase in shipbuilding in the United States and other countries.

Two more German raiders were active during the year. The famous *Möwe*, commanded by the Count zu Dohna-Schlodien, slipped past the Allied patrols in the North Sea in November, 1916, and returned to port again in March, 1917, after sinking 26 ships of 126,000 tons, and sending two to Germany with prize crews aboard. One of these was the *Yarrowdale*. The property loss is estimated at \$20,000,000. The total number of prisoners brought in by the *Möwe* and the two vessels not sunk was 1389. In December, 1916, another raider, the *Seeadler*, escaped the British blockade, and was wrecked in the Southern Pacific in August, after sinking 13 vessels.

## VI. AÉRIAL WARFARE

The year 1917 marked the ever-increasing importance of the aéroplane as a military asset. New and improved types were produced in greater numbers than ever before. The airplane has been called the eyes of the army and has lived up to this name more and more as the great battles of the year were fought. During the Battle of the Somme and the great German withdrawal, Gen. Haig depended on his air service to find out just what the Germans were doing and where the strategic points of the "Hindenburg Line" were. We find the use of the aéroplane developed probably to its greatest extent during the spring and summer campaigns of the Italians and during their retreat to the Piave. Fleets of 150 or more giant Caproni machines would fly low to the ground and drop bombs on forming troops, lines of communications, and munition dumps, or they would rake the enemy with machine-gun fire.

The great increase in the number and effectiveness of aéroplanes naturally stimulated

the discovery and use of methods to counteract their activities. One of the most effective of these was "camouflage." This was the covering of trenches, artillery, and other things of military value with trees, painted scenes, etc., so that it would be hard to distinguish them from the rest of the landscape. A French official picture shows a life-size cow, made of paper, standing alongside of a railroad, running through a field. The proximity of the cow is expected to hide the fact that the field has a railroad running through it. Anti-aircraft guns, capable of throwing a shell effectively two or three miles into the air were also perfected. A gun of this type usually reduced to a marked degree the value of aéroplanes for any kind of work.

It would be almost impossible to describe the individual engagements in the air over the battlefronts. Hundreds of them, spectacular and daring, occurred every week, and the deeds of any one airman did not stand much above those of a dozen others. To give an idea of the aéroplane's activities, the official reports for a few months might be given. In April, 1917, 717 machines were brought or driven down on the Western Front alone, in May, 713, in July, 467, and in September, 704. Accurate figures are not available for losses on other fronts.

About 25 aërial raids were made on England during 1917, which destroyed a considerable amount of property and killed a great number of civilians. The military damage was practically nil. Probably the most successful raid from the German point of view was that on June 13. It was carried out in broad daylight, and resulted in the death of 97 persons, of whom 26 were school children, and the wounding of 437. The most disastrous from the German point of view was the one made on the night of October 19. At least 11 Zeppelins participated and on their way home five were lost in French territory. One was captured undamaged at Bourbonne-les-Bains. Twenty-seven were killed and 53 wounded as a result of this raid. Since the beginning of the war to January 1, 1918, a compilation of British reports show that as a result of air raids 616 persons have been killed and 1630 wounded in England.

Public opinion in England demanded reprisals but on account of distance, etc., the Government refused to heed the popular clamor. England and France confined their aërial activities to the bombardment of purely military centres, such as the submarine bases at Ostend and Zeebrugge and the Krupp works at Essen.

The consensus of opinion concerning aërial warfare seems to be that aircraft are absolutely essential as aids to other branches. They have done their most efficient work in directing artillery fire, observing enemy troop movements, and in taking photographs of hostile positions. Three years of use has practically decided that the use of Zeppelins in war is a failure, although a French military critic states that Germany is still manufacturing them at the rate of two a month.

After the United States entered the war the Allies felt that as soon as her vast resources were organized to turn out aircraft the supremacy of the air would indubitably be with them. The United States plans to build a standard "Liberty Motor," which combines all the best points of foreign make.

Other information on the war will be found in the following articles: AGRICULTURE; BAT-

Reed, *Serbia, A Sketch* (Boston); Bertrand Russell, *Why Men Fight* (New York); J. B. Pratt, *Democracy and Peace* (Boston); Emile Boutroux, *Philosophy and War* (New York), translated by F. Rothwell; Roland Hugins, *The Possible Peace* (ib.); E. A. Victor, editor, *Canada's Future* (ib.); II. G. Wells, *Italy, France, and*

*Great Britain at War* (ib.); Donald Hankey, *A Student in Arms* (ib.); I. F. Marcossoson, *The War After the War* (ib.); A. N. Hyamson, *Palestine* (ib.).

**WARRENDER, Sir JOHN SCOTT.** A British naval officer, died in London, January 8, 1917. He was born in Scotland in 1860, second son of the sixth baronet Warrender of Lochend, East Lothian, whom he succeeded in 1901. Entering the navy as a cadet at thirteen, he early saw active service with the naval brigade in the Zulu war, and received a medal with clasp for gallantry at the battle of Ginghilovo. During the China war in 1900 he was flag captain to the rear admiral of the China squadron. While commander-in-chief of the East India Station (1907-09) he was promoted to rear admiral and in 1913 to vice admiral. Meanwhile he had been in command of the second cruiser squadron. When the European war opened, he had been commander of the second battle squadron since 1912. This post he retained till 1916, when he was appointed commander-in-chief at Plymouth. Illness forced his resignation before the end of the year. Admiral Warrender received the K.C.V.O. in 1911 and the K.C.B. in 1913.

**WAR REVENUE ACT.** See LIQUORS; FINANCIAL REVIEW; TAXATION; and UNITED STATES.

**WARSHIPS.** See BATTLESHIPS; SUBMARINES.

**WASHINGTON. POPULATION.** The population of the State in 1910 was 1,141,990 and on July 1, 1917, it was estimated to be 1,597,400.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. Bu.	Value
Corn	1917	41,000	1,517,000	\$2,458,000
	1916	38,000	1,406,000	1,406,000
Wheat	1917	1,855,000	29,218,000	56,391,000
	1916	1,590,000	37,635,000	53,818,000
Oats	1917	292,000	11,241,000	9,106,000
	1916	275,000	14,300,000	7,293,000
Potatoes	1917	79,000	9,875,000	9,085,000
	1916	60,000	9,900,000	9,702,000
Hay	1917	808,000	1,778,000	35,560,000
	1916	800,000	1,920,000	26,496,000

a Tons.

**MINERAL PRODUCTION.** The value of the gold, silver, copper, lead, and zinc mined in Washington in 1917, according to the estimate of the United States Geological Survey, was about \$2,238,000, an increase of 9 per cent over the value in 1916. There was a decrease in the production of gold, silver, copper, and zinc, but an increase in that of lead. This increase and the higher prices of metals in 1917 gave the output a value slightly above that of 1916, which was \$2,048,350. Strikes at the Canadian smelters at different times during the year caused a curtailment of shipments from Washington, especially from the Republic and Chewelah districts. The plant at Trail, B. C., which owns and operates several mines at Republic, was idle in December. The Northport Smelting and Refining Co., however, operated a lead plant throughout the year and received much of the siliceous ore from Republic.

The mine production of gold decreased from \$577,655 in 1916 to about \$486,000 in 1917. The mine output of silver decreased to about 257,000

ounces, or over 23 per cent. The value of the output was about \$208,000. Most of this silver came from copper ore mined in the Chewelah district, and a large part of the remainder from siliceous ores mined in the Republic district. The ore output of both districts was less than in 1916. The copper output decreased to about 2,000,000 pounds, valued at \$607,000. The output of copper ore and concentrates would have been much greater if the smelters had been able to receive the ore. The lead output increased to over 9,000,000 pounds, valued at about \$824,000, representing an increase of nearly 4,000,000 pounds in quantity, and \$450,000 in value.

There was a marked decrease in the zinc output in 1917, for the Great Western and Last Chance properties ceased operations in 1916. The ore shipped from the Lead Zinc property at Metaline Falls, however, produced more than a million pounds of spelter. Part of the ore was shipped to eastern zinc smelters and part was treated in the electrolytic plant at Trail, B. C.

**TRANSPORTATION.** The total railway mileage of the State on July 30, 1915, the latest for which statistics are available, was 8022. This includes mileage of all kinds. The railroads having the longest mileage were: The Great Northern, 1196; the Oregon and Washington, 992; Chicago, Milwaukee, and St. Paul, 583; the Northern Pacific, 1955.

**FINANCE.** The report of the State treasurer for the biennial period October 1, 1914, to September 30, 1916, showed a balance on hand on October 1, 1914, of \$750,656. The total receipts for the period were \$6,963,403, and the disbursements were \$6,269,548, leaving a balance on hand on September 30, 1916, of \$1,444,510.

**EDUCATION.** The total school population in 1917 was 310,333. The total enrollment was 251,612, with the average daily attendance of 103,092. The number of male teachers were 1946 and of female teachers 7546. The average yearly salary of male teachers was \$894.18 and that of female teachers was \$656.72. The total expenditure for school purposes in 1915-16 was \$14,333,342.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Western State Hospital at Fort Steilacoom, the Eastern State Hospital at Medical Lake, the Northern State Hospital at Sedro-Woolley, the Institute for the Feeble-Minded at Medical Lake, the State Soldiers' Home at Orting, Soldiers' Colony at Orting, the Washington Veterans' Home, the State School for the Deaf at Vancouver, the State School for the Blind at Vancouver, the State Penitentiary at Walla Walla, the State Training School for Chehalis, the State Reformatory at Monroe, and the State School for Girls at Grand Mount.

**POLITICS AND GOVERNMENT.** On April 18, the authorities of the army arrested the local officers of the Industrial Workers of the World on the charge of inciting strikes in the lumber and fruit industries, and preaching sedition.

War activities and enthusiasm were keen in the State during the year. Of the first ships launched of the United States emergency fleet, two were launched in Seattle, one in Grays' Harbor in the State of Washington, and the others at San Diego, Cal. The largest cantonment was established at Camp Lewis, near Ta-

coma. The beet sugar industry was greatly increased during the year in the Yakima Valley. Twelve million pounds were produced, and it is believed that at least thirty million will be produced next year. It is believed that within two or three years the Northwest will be entirely self-supporting as regards sugar.

**LEGISLATION.** Among the more important measures passed at the legislative session of 1917 are those noted below. Laws pertaining to judicial procedure were amended in some details. Provision was made for the drawing of alternate jurors in a trial for felony where the judge is of the opinion that the trial is likely to be a protracted one. The eight-hour law for men was amended so that it is a misdemeanor for a man to work over eight hours in the mines. The Workingman's Compensation Law was amended in unimportant details. An injured employee is given the choice of a physician, and a board was established to fix fees, consisting of the chief medical advisor of the Compensation Commission, one employer, and one employee. A general codification of the laws relating to the waters of the State was authorized. The banking laws were amended and deposits guarantee funds were established.

**STATE OFFICERS.** Governor, Ernest Lister; Lieutenant-Governor, Louis F. Hart; Secretary of State, L. M. Howell; Treasurer, W. W. Sherman; Auditor, C. W. Clausen; Superintendent of Education, Josephine Corlies Preston; Attorney-General, W. V. Tanner; Adjutant-General, Maurice Thompson; Commissioner of Public Lands, Clark V. Savidge; Commissioner of Insurance, H. O. Fishback—all Republicans except governor, who is a Democrat. Maurice Thompson, office appointive.

**JUDICIARY.** Supreme Court: Chief Justice, O. G. Ellis; Associate Justices, Mark A. Fullerton, J. Stanley Webster, S. J. Chadwick, E. N. Parker, George E. Morris, John F. Main, O. R. Holcomb, Wallace Mount. Clerk, C. S. Reinhart.

**WASHINGTON, UNIVERSITY OF.** A co-educational State institution at Seattle, Wash. In the fall of 1917 there were 2379 students and 185 members of the faculty; student enrollment fell off 50 per cent over the preceding year. The library contained 83,831 volumes. The university owns timber land worth \$3,000,000. In 1917 a school of business administration was organized with an entirely new faculty, Carleton H. Parker, professor of economics, being made dean. A school of library economy was also organized. The university was founded in 1861. President, Henry Suzzalo, Ph.D.

**WASHINGTON AND LEE UNIVERSITY.** A non-sectarian institution for the education of men at Lexington, Va. In the fall of 1917 there were 381 students and 26 members of the faculty; 6 professors entered government service. The library contains approximately 55,000 volumes. Productive funds in 1917 amounted to \$952,172 and the income therefrom to \$57,446. The university was founded in 1783. President, Henry Louis Smith, Ph.D.

**WASHINGTON UNIVERSITY.** A non-sectarian co-educational institution at St. Louis, Mo. In the fall of 1917 there were 1936 students and 226 members of the faculty. The library contained 163,419 bound volumes and 60,196 pamphlets. During the year the university received a gift of \$1,166,666 for the medical

department. Productive funds in 1917 amounted to \$11,983,282 and the income therefrom to \$512,773. The university was founded in 1853. Chancellor David F. Houston resigned in 1917 and Frederic A. Hall was appointed to succeed him.

**WATERHOUSE, JOHN WILLIAM.** An English painter, died in London, February 10, 1917. The son of a painter, he was born in Rome, Italy, in 1849. He went to England to study in the Royal Academy Schools, but was largely self-taught. By 1885 he had been elected Associate of the Royal Academy, where he had exhibited since 1874, and by 1895 Academician. He became known chiefly by his pictures illustrative of myths or legends, such as "The Magic Circle," "Consulting the Oracle," "St. Eulalia," and "The Lady of Shalott," all in the Tate Gallery, London. Others fine in color and decorative quality include "Hylas and the Nymphs" (Manchester), "Echo and Narcissus" (Liverpool), "The Soul of the Rose," and "Thiabe." His work partakes in character of both the pre-Raphaelite and Burne-Jones tendencies.

**WATER PURIFICATION.** See **WATER-WORKS.**

**WATER-WORKS AND WATER PURIFICATION.** In the field of water-works construction the two greatest events of the year were the completion of the Catskill Aqueduct and the provision of water-supplies for the various army cantonments. The aqueduct, which has been described in previous issues of the **YEAR BOOK**, will eventually bring 500,000,000 gallons of water daily to New York City from storage reservoirs in the Catskill Mountains. It was under construction for a dozen years, and with its various dams and reservoirs, has cost about \$177,000,000. J. Waldo Smith was chief engineer of the work and at times had under his direction a staff of a thousand men—not including those at work for the contractors. See **AQUEDUCTS.**

**CANTONMENT WATER-SUPPLIES.** The first step in providing water-supplies for the sixteen national army cantonments, each to house 40,000 men, was to prepare general specifications. These were drawn after careful deliberation by a group of the most eminent hydraulic engineers in the country, acting in an advisory capacity to the committee on emergency construction and engineering of the General Munitions Board. With these engineers were two representatives of the National Board of Fire Underwriters and an engineer from the quartermasters' division of the army, who had had much experience in designing water-supplies for army posts. An allowance of 55 gallons per man per day was made, which included 15 gallons apiece for horses or mules, or 50 gallons net per man. This was about 80 per cent more water per man, on the average, than was allowed in the British, French, Belgian, German, or Canadian cantonments. After these American camp water-supplies went into use they proved ample and in a few cases the consumption was kept down to 30 gallons a day. An additional supply was required at one camp on account of the use of 500,000 to 600,000 gallons a day for steam heating. The per capita figure given was for average use. Provision was made, by storage or otherwise, to supply 2.85 times the average, within three minutes' notice, for a period of one hour. The specifications called

for pressures of 60 to 85 pounds per square inch.

At each camp, careful studies were made of available sources of supply and the best were chosen. A variety of sources and modes of supplies resulted. In some cases a supply was bought from a near-by municipal plant. To secure quick delivery and facilitate laying, wire-wound wood stove pipe was extensively used. About 70 per cent of mileage was of wood instead of cast iron, the average cost of the wood being about 60 per cent that of iron. Owing to the use of wood and the density of population of the camps the cost of the water-supplies for 16 cantonments was less than \$11 per capita, or about a fifth the per capita cost of the average municipal water system. Even more remarkable was the fact that while the time usually allowed for planning and building city water-works to supply 40,000 people was three years, the cantonment water-works, under most difficult conditions as to materials, transportation, and labor, were planned and built in a little over three months.

**REFORESTING WATER-WORKS DRAINAGE AREAS.** Gathering grounds for city water-supplies drawn from surface sources are often and wisely bought by the cities to protect their supplies from contamination. Up to spring planting time in 1917, the Conservation Commission of New York State had supplied 3,600,000 seedlings and transplants to some 30 different water-works in the State. About 3,200,000 of this stock were pine. About 30 per cent of the stock went to New York City and 20 per cent to Rochester. The City of New York, through its Board of Water-Supply, has planted more than 2,000,000 small trees around and near the Ashkoken and Kensico reservoirs. Some of this stock was raised in its own nurseries. The varieties included Norway spruce, arbor vitae, Scotch, red, white, Austrian, Jack, and bull pine.

As the result of a campaign started in 1917 by the Pennsylvania forestry commissioner, 26 water-works in the State named ordered 446,000 seedlings from the State nursery. The New Haven (Conn.) Water Co. has established the policy of planting 350,000 trees a year. Since it began keeping records, nine years ago, it has spent \$37,000 in forestry work, including planting and improvement cutting, and has made a profit of \$9000.

**WATER PURIFICATION.** With increasing speed the cities of the country which draw their water-supplies from surface sources were establishing filtration plants. Among those which had not done so chlorination was becoming the rule. Chlorination is also commonly practiced even where water is filtered, since at slight expense it provides an added safeguard—continuous insurance—against water-borne typhoid. In fact, there may be practically no extra expense, for with chlorination in use a more rapid rate of filtration or a reduction in coagulant is often feasible. Liquid chlorine is displacing hypochlorite as a chlorinating agent. For new filter installations, rapid or mechanical rather than slow sand filters were now generally employed. In a paper read before the New England Water-Works Association in September, George A. Johnson reviewed this history and status of mechanical filters: The first municipal rapid filter was built at Somerville, N. J., in 1885. At that time there were only a few slow sand

filters in the United States. At the beginning of 1917, there were in the United States 682 rapid sand filter plants on city water-works, supplying 13,411,000 people, or 74 per cent of the 18,293,000 people then being furnished with filtered water, while 54 slow sand filters were supplying 4,882,000 people. Since 1910, the population of the United States supplied with filtered water has increased 69 per cent and the number of filter plants 81 per cent.

The introduction of filtered water had cut down the typhoid rate in many American cities. A notable instance of this was recorded by Charles B. Burdick in *Engineering News-Record* of September 6, 1917. The city was Niagara Falls, N. Y. For more than ten years prior to 1912, there had never been less than 22 typhoid deaths in the city and from that up to 55 deaths a year. For the period 1899 to 1911, the average annual typhoid death rate was 131 per 100,000. The entire water-supply of the city had been filtered since the middle of 1912. The drop in typhoid was immediate. In 1915 there was not a single typhoid death in the city. For the four years following complete filtration, the average typhoid death rate was 11 per 100,000, while in the three years ending with 1916 it was only 5.3.

Good bacterial results were being obtained in 1917 from a combined mechanical filtration and ultra-violet-ray water treatment plant put in operation late in 1916 at Henderson, Ky. The plant had a daily capacity of about 4,000,000 gallons and was the first municipal plant in the world to treat water under pressure by means of the ultra-violet-ray. An illustrated description of the plant appeared in *Engineering News-Record*, November 20, 1917. A leading work in the bibliography for the year was Ellms, *Water Purification* (New York City).

**WEATHER BUREAU.** See METEOROLOGY.

**WEIGHTS AND MEASURES.** On November 1, 1917, there went into effect the Federal Standard Container Act, entitled "An Act to fix standards for Climax baskets for grapes and other fruits and vegetables, and to fix standards for baskets and other containers for small fruits, berries, and vegetables, and for other purposes," approved August 31, 1916 (39 U. S. Stats. at Large, p. 673). This act prescribes definite sizes for baskets, used for fruits and vegetables, specifying the dimensions and capacity of the various containers permitted. Three standard sizes were provided for general use, two quarts, four quarts, and twelve quarts, while there were established the dry half-pint, dry quart, and multiples of the dry quart as standards for containers for small fruits, berries, and vegetables, the capacities for which are fixed in cubic inches. After November 1, 1917, it was made unlawful to ship anything from State to State in baskets or containers that did not conform to the law, or to sell or to ship containers of non-conformable size. The statute further contains specified tolerances and variations for the different containers.

A meeting of manufacturers was held at Birmingham Chamber of Commerce in October to consider the establishment of a local or district Bureau of Standards of Length, and there was unanimous approval of a scheme presented on this occasion. It was the intention to make the bureau a department which would aim at the highest class of scientific work, recognizing

the needs of the Midland industries for cheap as well as accurate sets of standardized gauges. The declared object was not to make the proposed bureau a manufacturing concern, but a centre of scientific work on behalf of local industry which at the outset would be confined to the testing and setting up of length gauges. The management and general control of the proposed work was to be placed in the hands of a body composed of scientific and business men, and the condition was laid down that no standard would be recommended for general adoption until it had been tested in the shops.

**WELCH, JAMES.** An English comedian, died in London April 10, 1917. He was born in Liverpool in 1865 and made his first appearance on the stage at the Globe Theatre, London, playing with Wilson Barrett in *The Golden Ladder*. Among the more notable plays in which he had comedy rôles were Shaw's *Widowers' Houses*, *Arms and the Man*, and *You Never Can Tell*, and Ibsen's *An Enemy of the People* and *John Gabriel Borkman*. But his greatest success, and a remarkable one, was as Sir Guy de Vere in *When Knights Were Bold*, which was first produced in Nottingham in 1906, ran in London during 1907-08, then was taken on tour for three years, and has been revived several times. Under the management of Sir Charles Wyndham he appeared at the Criterion Theatre, London, in *Betsy*, *My Friend the Prince*, and other plays, while those in which he supported Barrett included *The Sign of the Cross*, *Claudian*, *The Silver King*, and *Romany Rye*.

**WELLESLEY COLLEGE.** A non-sectarian institution for the education of women at Wellesley, Mass. In the fall of 1917 there were 1612 students and 138 members of the faculty. The library contained 90,927 volumes. For the year ending June 30, 1917, the productive funds amounted to \$2,727,159 and the income therefrom to \$151,380. The college is planning for the erection of a group of new academic buildings, Mr. Ralph A. Cram being the supervising architect. The college was founded in 1875. President, Ellen Fitz Pendleton, LL.D., Litt.D.

**WELLS, CHARLES.** An English Orientalist, died October 4, 1917, in Brighton, England. He was born in London in 1838 and was educated in that city at King's College, where he won the Turkish prize in 1860. He was professor of English in the Imperial Naval College at Constantinople, in 1870-74, was appointed professor of Turkish in King's College, London, in 1889, and Oriental translator to the British foreign office in 1892. His published works include: *Ilm-Tedbir-i-Muek* (1860), an essay on Turkish political economy; *Mehemet, the Kurd, and Other Tales from Eastern Sources* (1865); *A Practical Grammar of the Turkish Language* (1880); *The Literature of the Turks* (1891); and a revised and enlarged edition of Redhouse's *Turkish Dictionary* (1880).

**WESLEYAN METHODIST CONNECTION IN AMERICA.** This denomination starting in Michigan in 1841 under the name of Wesleyan Methodists, was organized in Utica, N. Y., in 1843, as an anti-slavery and non-episcopal church. At the close of the Civil War many who had joined the new church, seeing that slavery was abolished, returned to the churches to which they had originally belonged or joined new churches. The denomination emphasizes the Wesleyan doctrines of justification and holiness

as essential to salvation. According to *The Methodist Year Book* for 1918, this denomination had in 1917, 840 ministers; 1912 lay preachers; 20,669 members; 491 Sunday schools; 2523 officers and teachers; 21,211 Sunday school scholars; and 675 churches. There are foreign missions in Sierra Leone, Africa and in India. There are three schools of college grade: At Houghton, N. Y.; Central, S. C.; Miltonvale College, Miltonvale, Kan.; Theological School, Fairmount, Ind.

**WESLEYAN UNIVERSITY.** A non-sectarian institution for the education of men at Middletown, Conn. In the fall of 1917 there were 402 students and 43 members of the faculty; of the latter 5 are in the military service of the government. The library contains 110,000 volumes. Productive funds in 1917 amounted to \$2,495,500 and the income therefrom to \$129,812. The university was founded in 1831. President, William Arnold Shanklin, LL.D., L.H.D.

**WESTERN AUSTRALIA.** A State of the Commonwealth of Australia. It extends from the Indian Ocean to the Northern Territory and South Australia at long. 129° E. It is the largest State of the Commonwealth. The estimated area is 975,920 square miles, which is about 32.8 per cent of the area of the Commonwealth and more than fourteen times the area of the State of Missouri. The estimated population at the end of 1916 was 309,188 (160,334 males, 148,854 females), as compared with 319,859 (173,309 males, 146,550 females) at the end of 1915 and 282,114 at the 1911 census. These figures are exclusive of full-blooded aboriginals. The capital is Perth, which with suburbs (including Fremantle) had 106,792 inhabitants in 1911. There were reported for 1916 8599 births, 3106 deaths, 20,965 arrivals, 35,286 departures.

The legislative power is exercised by a parliament of two houses, the Legislative Council and the Legislative Assembly. The Council consists of 30 members, elected for six years; the Assembly, 60 members, elected for the duration of parliament, which is limited to three years. Woman suffrage was adopted by an act of 1899. Maj. Gen. Sir Harry Barron retired as governor late in 1916, and was succeeded in 1917 by Sir William Grey Ellison Macartney, who was transferred from the governorship of Tasmania. Premier, H. B. Lefroy (June, 1917). See AUSTRALIA.

**WESTERN RESERVE UNIVERSITY.** A non-sectarian institution of learning at Cleveland, Ohio. It was founded as Adelbert College in 1826 and now comprises this college as well as a college for women and several professional departments. In the fall of 1917 there were 3165 students and 340 members of the faculty; students and members of the faculty in the national service in 1917 numbered 310. The library contained 129,000 volumes. Productive funds in 1917 amounted to \$3,610,129 and the income to \$163,567. Gifts amounting to \$450,000 were received in 1917. Courses in military training and tactics were included in the curriculum of Adelbert College and military training was made compulsory. President, Charles Frankling Thwing, D.D., LL.D., Litt.D.

**WEST POINT.** See UNITED STATES MILITARY ACADEMY.

**WEST VIRGINIA. POPULATION.** The population of the State in 1910 was 1,221,119, and on July 1, 1917, it was estimated to be 1,412,602.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. Bu.	Value
Corn .....	1917 884,000	25,020,000	\$42,534,000
	1916 740,000	22,570,000	22,796,000
Wheat .....	1917 315,000	4,410,000	9,570,000
	1916 305,000	4,422,000	7,075,000
Oats .....	1917 143,000	3,861,000	8,050,000
	1916 140,000	3,220,000	2,061,000
Potatoes ..	1917 65,000	7,475,000	9,867,000
	1916 48,000	4,224,000	6,874,000
Hay .....	1917 790,000	1,003,000	21,163,000
	1916 825,000	1,270,000	18,415,000
Tobacco ...	1917 11,800	9,040,000	2,712,000
	1916 14,100	12,690,000	1,904,000

a Tons. b Pounds.

**MINERAL PRODUCTION.** The production of coal in the State in 1916 amounted to 86,460,127 net tons, valued at \$102,366,092, an increase compared with 1915 of 9,276,058 tons, or 12 per cent in quantity, and of \$27,804,743, or 37 per cent in value. Practically every district in the State shared in the increase. The car supply was adequate in the first half of the year, but was generally short in the last quarter. There was a shortage of labor in practically all parts of the State.

The production of petroleum in the State in 1916 was 8,731,184 barrels, valued at \$21,914,080, compared with 9,264,798 barrels, valued at \$14,468,278 in 1915. The State held seventh place as an oil producing State. These figures showed a decrease of 6 per cent in quantity, but an increase of 51 per cent in value.

West Virginia leads all the States in the value of its natural gas productions, recording in 1916, \$47,603,396, nearly twice the value of Pennsylvania, the next State in importance.

**TRANSPORTATION.** The railway mileage of the State in 1916 was 3740. The railways having the longest mileage were: The Baltimore and Ohio, 1127; the Norfolk and Western, 452; Western Maryland Railway Company, 198; the Virginian Railway Company, 119.

**FINANCE.** According to the State treasurer's report, the receipts for 1917 were \$10,548,854; the expenditures \$10,158,531. At the beginning of the year there was a balance of \$4,021,844, and at the end of the year \$5,088,976. The State has no bonded debt.

**EDUCATION.** The total school population of the State in 1916 was 419,890. The total enrollment was 313,873, with an average daily attendance of 223,889. There were 4482 male and 5842 female teachers. The average yearly salary of teachers was \$332.41.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions include the Western State Hospital, the Spencer State Hospital, the Huntington State Hospital, the State Tuberculosis Sanatorium, the Welch State Hospital, No. 1, McKendree Hospital, No. 2, the Fairmont Hospital, No. 3, the West Virginia Penitentiary, the West Virginia Industrial School for Boys, the West Virginia Industrial Home for Girls, the West Virginia School for the Deaf and Blind, the West Virginia Colored Orphans' Home, and the West Virginia Children's Home.

**LEGISLATION.** Among the more important measures passed at the legislative session of 1917 are those noted below. A measure was passed providing for the better protection of judges against personal violence. This provides that in case any person assassinates, or attempts to assassinate, or feloniously assaults any judge, the governor shall offer a reward of not more than \$10,000 for the arrest of such persons, and may employ assistance for such purpose to the amount of not more than \$5000. The county courts are also authorized to offer a reward for not more than \$5000 for the same purpose. The election laws were amended, and a scheme for double election boards, one to receive the votes and another to count them, was put into effect. The department of mines was authorized to make regulations necessary to secure safe and sanitary working conditions in the mines of the State. Amendments were made to the laws relating to the drainage of lands. The legislature of the State, in February, refused to make provision for the payment of the State's portion of the Civil War debt, which it has been ordered by the Supreme Court of the United States to pay to Virginia. It is resolved by the legislature not to pay the money until the court has heard the testimony of the late legislators on the motion of a writ of mandamus which compels the State to pay its portion of the debt. The sum in question amounts to \$12,393,929.

**STATE OFFICERS.** Governor, John J. Cornwell; Secretary of State, Houston Goff Young; State Superintendent of Free Schools, M. P. Shawkey; Auditor, John S. Darst; Commissioner of Agriculture, James H. Stewart; Attorney-General, E. T. England; Treasurer, William S. Johnson; Adjutant-General, John C. Bond; Commissioner of Insurance, J. S. Darst, ex-officio—all Republicans except governor, Dem.

**JUDICIARY.** Supreme Court of Appeals: President, L. Judson Williams; Associate Judges, George Poffenbarger, William N. Miller, Charles W. Lynch, Harold A. Ritz; Clerk, W. B. Matthews.

**WEST VIRGINIA UNIVERSITY.** A co-educational State institution at Morgantown, W. Va. In the fall of 1917 there were 917 students and 118 members of the faculty. A. C. Callan was elected professor of mining engineering to succeed E. N. Zern, resigned. C. H. Winkler was elected full professor in charge of the work under the Smith-Hughes Bill and Paul Rouzer was elected assistant professor of agricultural education. Theodore Zucker, professor of physiological chemistry, and H. M. Gould, assistant in anatomy and neurology, were added to the faculty of medicine. A. C. Fleshman was made assistant professor of education. The library contains 62,000 volumes. Productive funds in 1917 amounted to \$115,104 and the income therefrom to \$6000. From the estate of Lawrence A. Reymann, the university received in 1917 a valuable farm of 900 acres in Hardy County and with it valuable live stock and farm equipment. Under university management the farm was put on a paying basis and is the leading institution of its kind in the State. The university was founded in 1867. President, Frank Butler Trotter, LL.D.

**WHEAT.** The wheat crop of the world in 1917 was below the annual average, which is about 3,825,000,000 bushels. This was especially significant in view of the fact that the world's

crop of 1916 had been unsatisfactory and that there was little or no surplus. While complete statistics were not available, the production of sixteen countries of the northern hemisphere reporting to the International Institute of Agriculture at Rome was nearly 15 per cent below the average for the five years 1911-15, and also more than 1 per cent under that of 1916. Only five of these countries reported a production above the average of the five-year period mentioned. These were Spain producing 140,921,000 bushels, the United Kingdom 63,748,000 bushels, British India 378,781,000 bushels, Japan 26,501,000 bushels, and Tunis 6,955,000 bushels. The production and area of British India were the highest on record for that country.

The production of the United States as estimated by the Department of Agriculture at the end of the year, was 650,828,000 bushels, of which 232,758,000 bushels were spring wheat and 418,070,000 bushels winter wheat. The total area was 45,941,000 acres, of which 18,511,000 acres were in spring wheat and 27,430,000 acres in the fall-sown crop. The winter wheat area was much reduced by losses from winterkilling, as in the fall of the preceding year 40,534,000 acres were sown. This placed the winter wheat area below that of 1916 which was 34,709,000 acres, and also below the average for the five years, 1911-15. The spring wheat area was nearly a million acres greater than the area of 1916, and only 450,000 acres under the five-year average. The area sown to winter wheat in 1917 for the 1918 crop was estimated at 42,170,000 acres, the leading States being Kansas with 9,479,000 acres, Oklahoma with 3,264,000 acres, and Nebraska with 3,135,000 acres. The average farm value on December 1, 1917, was 200.9 cents per bushel, as compared with 160.3 cents the year before, and on this basis the total value of the crop was \$1,307,418,000. The corresponding figures for winter wheat were 202.9 cents per bushel and \$848,372,000 total crop value, and for spring wheat 197.2 cents per bushel and \$459,046,000 total crop value. These values for spring and winter wheat separately or combined were unprecedented.

It was estimated that the 1917 crop of the United States, on the basis of a per capita consumption 10 per cent less than the normal, would assure a surplus of nearly 70,000,000 bushels, while the average surplus for the years 1907-13 was 108,844,000 bushels. During the fiscal year ended June 30, 1917, the United States imported 24,924,985 bushels of wheat and exported 293,578,700 bushels. The wheat production of Canada for this year was estimated at 231,730,000 bushels on 13,513,650 acres, the average yield per acre being about 15½ bushels, as compared with 17 bushels in 1916. The production included 17,816,000 bushels of winter wheat and 213,914,000 bushels of spring wheat. The quality of the wheat was good.

The international commerce and the domestic trade of countries was subjected to control by belligerent as well as neutral governments. In most instances the exportation of wheat and wheat products was prohibited or so regulated that supplies in general passed from a country to its dependencies or *vice versa*. Among the nations allied against the central European powers the surplus wheat countries furnished

supplies to the importing countries of the group and stores were also transferred, especially in Rumania, by conquest. Many countries also enacted laws regulating milling processes to avoid possible losses of food material. Italy, for instance, fixed the yield of flour at 85 per cent of the weight of the wheat, or at 51 pounds per bushel and allowing only the removal of bran.

The fixation of prices was a general rule and in most instances was continued from the preceding years of war conditions. Germany in March, 1917, fixed the price at \$1.64 per bushel, and offered a premium of 39 cents per bushel for delivery before August 1, of 26 cents before September 1, and 13 cents before October 1, of 1917. In Austria the price was fixed at \$2.20 per bushel in August and a premium of 11 cents per bushel was offered for delivery before November 1, 1917. The requisition price in France was fixed at \$2.62 per bushel in July, and in Great Britain in August at \$2.13. Other European countries, including some not engaged in the war, fixed the price even higher than the figures here mentioned.

During the year the United States Food Administration established the price for the 1917 crop at \$2.20 per bushel for No. 1 Northern Spring wheat at Chicago, \$2.17 at Minneapolis, and \$2.30 at New York, with similar variations for other wheat markets of the country and with prices on a relative basis for other grades and classes of wheat. Ocean freight rates for wheat were the same as for corn (q.v.). See AGRICULTURE; AGRICULTURAL LEGISLATION; FOOD CONTROL.

**WHEATLESS DAYS.** See FOOD CONTROL.

**WHEATLEY, HENRY BENJAMIN.** A British literary scholar, died in London, April 30, 1917. He was born in Chelsea in 1838 and was privately educated. At 23 he was appointed clerk to the Royal Society, an office he held for eight years, and from 1879 to 1908 he was assistant secretary of the Society of Arts. Mr. Wheatley was prominent in many learned organizations, such as the Early English Text Society, of which he was honorary secretary and for many years treasurer. At various times he was president of the Samuel Pepys Club and the Bibliographical Society, prior of the Johnson Club, and chairman of the Council of the Shakespeare Association. His publications relating to Pepys included *Samuel Pepys and the World He Lived In*, a new edition of *Pepys' Diary* (1894-99), and *Pepysiana*. Other of his books are: *Round About Piccadilly and Pall Mall*, *How to Form a Library*, *Literary Blunders*, *Historical Portraits*, *The Story of London*, *Hogarth's London*. He also edited the *Diary and Correspondence of John Evelyn* and other works. Durham University gave Mr. Wheatley an honorary degree of D.C.L.

**WHISKEY.** See LIQUORS.

**WHITE PINE BLISTER RUST.** See BOTANY, *Plant Diseases*.

**WHOOPIING COUGH.** Ruckle of Grand Rapids, Wis., has examined the lingual tonsil in 43 cases of whooping cough that have come under his notice and found in every case a decided enlargement of this gland, with or without other throat symptoms. It is a well known clinical fact that inflammation and enlargement of the lingual tonsil may be responsible for stubborn, long continued coughs, and that ap-

propriate local treatment generally brings about a cure. It is possible therefore that Ruckle's observations may result in the formulation of a new and important therapeutic aid for the cure or relief of this disease. A careful study of the value of pertussis vaccine was made by Luttinger, of the New York City Department of Health, both from the prophylactic and curative standpoint.

**WILLIAMS COLLEGE.** A non-sectarian institution for the education of men at Williams-town, Mass. In the fall of 1917 there were 434 students and 61 members of the faculty; at the time of the declaration of war in 1917 there were 514 men enrolled in the college and at the end of the year 287 of these were in government service, as were also 17 members of the faculty, including the president of the institution, Henry A. Garfield, who is United States fuel administrator. The total number of alumni and students in service in 1917 was 910. Volumes in the library number 89,747. Productive funds in 1917 amounted to \$2,506,006 and the income therefrom to \$251,791. Frederick C. Ferry, for fifteen years dean of the college, accepted the presidency of Hamilton College in 1917. Williams College was founded in 1793. Chairman of the faculty *pro tempore*, Professor H. D. Wild.

**WILSON, T. WOODROW.** See UNITED STATES; UNITED STATES AND THE WAR; WAR OF THE NATIONS, *Diplomacy of the War*; *Naval Operations*.

**WINDWARD ISLANDS.** The British West Indian colonies of St. Lucia, St. Vincent, and Grenada; together with the Grenadines, attached partly to Grenada and partly to St. Vincent. Each colony retains its separate institutions, but the three are united for administrative purposes under one governor. See the articles under the separate titles.

**WINE.** See LIQUORS.

**WINTER, WILLIAM.** An American author and one of the best known dramatic critics of his time. He was born in Gloucester, Mass., on July 15, 1836, and died on June 30, 1917. He was graduated from the Harvard Law School in 1857, but immediately entered upon a literary career. In 1859 he became dramatic critic of the *Saturday Press* (New York City) and from 1861 to 1865 held the same position on the *New York Albion*. From 1865 to 1909 he was dramatic critic of the *New York Tribune*, and became widely known not only for his critical articles but for his biographical notes on actors, reminiscences, verse, and his sketches of English scenery and historic localities. In 1916 a testimonial was tendered him by players and playgoers in New York City. His writings include: *Henry Irving*; *Shakespeare's England*; *The Stage Life of Mary Anderson*; *Gray Days and Gold*; *Old Shrines and Ivy*; *Shadows of the Stage*; *The Life and Art of Edwin Booth*; *The Life and Art of Joseph Jefferson*; *Brown Heath and Blue Bells*; *Other Days of the Stage*; *Old Friends*; *Poems*; *Life and Art of Richard Mansfield*; *The Wallet of Time*; *Shakespeare on the Stage*; *Vagrant Memories*. He also edited the works of George Arnold; John Brougham; Fitz-James O'Brien; and *The Shakespearean and Miscellaneous Plays of Edwin Booth*.

**WIRELESS STATION, SAYVILLE, L. I.** See UNITED STATES AND THE WAR.

**WISCONSIN. POPULATION.** The population

of the State in 1910 was 2,333,830, and on July 1, 1917, it was estimated to be 2,527,167.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

	Acreage	Prod. Bu.	Value
Corn .... 1917	1,918,000	42,196,000	\$88,779,000
1916	1,890,000	60,840,000	55,973,000
Wheat ... 1917	289,000	5,327,000	10,761,000
1916	188,000	3,315,000	5,304,000
Oats .... 1917	2,250,000	99,000,000	65,340,000
1916	2,200,000	81,400,000	41,514,000
Potatoes . 1917	307,000	34,998,000	31,498,000
1916	290,000	18,630,000	20,036,000
Hay ..... 1917	2,703,000	a 4,595,000	79,494,000
1916	2,600,000	4,420,000	51,272,000
Tobacco . 1917	48,300	b 45,885,000	8,030,000
1916	43,900	55,753,000	6,969,000

a Tons. b Pounds.

**MINERAL PRODUCTIONS.** Wisconsin ranked fifth among the States in the production of iron ore in 1916, being surpassed only by Minnesota, Michigan, Alabama, and New York. The total production in 1916 was 1,304,518 gross tons, compared with 1,095,388 tons in 1915. There were shipped from the mines of the State in 1916 1,529,459 gross tons valued at \$3,644,542, compared with 1,125,269 tons, valued at \$2,188,012 in 1915, an increase of 36 per cent in quantity and 67 per cent in value.

The value of the mined output of lead and zinc in 1916 was \$15,643,138 compared with \$10,486,212 in 1915. The total metal content of the lead produced was 3043 short tons, valued at \$419,934 and of zinc 56,803 short tons, valued at \$15,223,204 in 1916.

**TRANSPORTATION.** The total railway mileage in the State on December 31, 1916, was 7597. The railways having the longest mileage were: Chicago and Western, 2168; Chicago, Milwaukee, and St. Paul, 1796; Minneapolis, St. Paul, and Sault Ste. Marie, 1352.

**FINANCE.** According to the report of State treasurer for 1917, the total receipts were \$20,108,636. The expenditures during the year were \$20,204,731. The balance at the beginning of the year was \$3,698,278, and at the end of the year \$3,602,184. The State has no bonded debt.

**EDUCATION.** The school population of the State in 1916 was 801,456. The enrollment was 458,102, with an average daily attendance of 371,494. The number of teachers was 16,288. The expenditure for city schools was \$8,700,000; for rural schools, \$4,240,000; for graded schools, \$2,170,000; for village schools, \$2,970,000; for the University of Wisconsin, \$2,500,000; for normal schools, \$1,115,000; for continuation schools, \$733,000. The total expenditures were \$22,718,000.

**CHARITIES AND CORRECTIONS.** The charitable and correctional and penal institutions of the State include the following: The State Hospital for the Insane at Mendota, the Northern Hospital for the Insane at Winnebago, the School for the Deaf at Delavan, the School for the Blind at Janesville, the Industrial School for Boys at Waukesha, the Wisconsin State Prison at Waupun, the State Public School at Sparta, the Home for the Feeble-Minded at Chippewa Falls, the State Reformatory at Green Bay, the State Tuberculosis Sanatorium at Wales, the Hospital for the Criminal Insane,

at Waupun, Tomahawk Lake Camp, the Milwaukee Hospital for the Insane at Wauwatosa, and the county asylums for the chronic insane.

**POLITICS AND GOVERNMENT.** The Senate, in May, voted to expel Senator Frank Raguse from the Milwaukee district, on account of an offensive and disloyal speech made by him. The vote for expulsion was practically unanimous. This action is in accordance with the Wisconsin constitution, which provides that each House of the legislature may expel a person for contempt, or disloyal behavior, by a two-thirds vote. Mr. Raguse, a German by birth, charged the American government with having plotted the destruction of the *Maine* in order to bring on the Spanish-American War, and declared that the same spirit was evident at the present day. Upon his refusal to sign a prepared retraction of his assertions, he was expelled.

Senator La Follette was the storm centre throughout the year for his opposition in Congress and outside, to the government war measures (see UNITED STATES, sections on Congress; and UNITED STATES AND THE WAR). As a result of an address made in St. Paul in September, a movement was started to have him expelled from the Senate. In obedience to public sentiment, a commission was formed in Congress to pass upon the charges of disloyalty. No action had been taken by the commission at the end of the year. On October 21 Senator Paul O. Husting was accidentally shot and killed while on a duck hunting trip at Rush Lake, Wisconsin. His successor had not been chosen at the end of the year.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below:

The laws relating to criminal procedure and the conduct of trials were amended. Provision was made for requiring the attendance of the witness at the trial of an action in another State, Territory, or country, of a person who is in the State of Wisconsin, but only if the laws of such other State, territory, or country contain similar provisions as to trials in Wisconsin.

The granting of a marriage license to any person with certain diseases was prohibited.

The State offices were authorized to take possession of the food supplies of the State upon the payment of a just compensation. The taking over of warehouses and other storage facilities was also authorized. Provision is made for seizing buildings, railroads, and other equipment or supplies useful for military purposes.

A moratorium, limited to men in the military and naval service, provided for the waiving of the statutes of limitations as applied to the bringing of actions by men in the service and for the continuance of actions against them.

The commission form of government was abandoned in the State.

Provision was made for the voting of citizens absent on military or naval service; the law also applies to those who are sick or physically disabled, and so unable to attend the polls.

Several acts looking to the safety of the public on highways were passed. It was required that warning signs were to be erected at the crossings, and provision was made for the removal of means of identification from stolen automobiles.

Measures were passed for the prevention of monopolies and unfair discrimination in the

buying and selling of commodities, especially of food products.

It was made a misdemeanor to issue trading stamps as an inducement to the purchase of goods of various sorts.

Laws relating to insurance were amended in important details. A commission was created to study the question of social insurance.

The banking laws of the State were amended. Amendments were made to the laws relating to health and sanitation.

**STATE OFFICERS.** Governor, Emanuel L. Philipp, Rep.; Lieutenant-Governor, Edward F. Ditmar, Rep.; Secretary of State and Auditor, Merlin Hull, Rep.; Treasurer, Henry Johnson, Rep.; Adjutant-General, Orlando Holway; Superintendent of Education, C. P. Cary; Commissioner of Agriculture, C. P. Norgord; Commissioner of Insurance, M. J. Cleary, Rep.

**JUDICIARY.** Supreme Court: Chief Justices, John B. Winalow; Associate Justices, Walter S. Owen, Robert G. Siebeck, James C. Kerwin, Aad John Vinje, Marvin B. Rosenberry, Franz C. Eschweiler; Clerk, Arthur A. McLeod.

**WISCONSIN, UNIVERSITY OF.** A co-educational State institution located at Madison, Wis. In the fall of 1917 there were 4043 students and 705 members of the faculty, the student enrollment being classified as follows: college of letters and science, 2776; school of engineering, 510; college of agriculture, 578; law school, 77; medical school, 108; school of music, 81; library school, 31. Seventeen per cent of the members of the faculty of the preceding year were in war service. There are 248,000 bound volumes in the library and 51,000 pamphlets. The students of the university also have access to the State Historical Library, the State Law Library, and the Legislative Reference Library, aggregating 297,000 bound volumes and 203,000 pamphlets. Endowment funds amounted to \$698,302 and the income from productive funds was \$34,705. A standing University Research Committee was established to work in cooperation with the National Research Council. Foreign language was changed from a required to an elective study in both the colleges of agriculture and in engineering. Courses in ordnance and in wireless and wire telegraphy were instituted. The university was founded in 1848. President, Charles R. Van Hise, LL.D.

**WOLHYNIC FEVER.** See VOLHYNIC FEVER.  
**WOMAN'S CHRISTIAN TEMPERANCE UNION, NATIONAL.** The Union held its forty-fourth annual convention at Washington, D. C., on December 2-7, 1917. There was a large attendance and great enthusiasm was shown in support of the campaign plans adopted for national constitutional prohibition. These included special services to be observed by local unions, appeals to senators and representatives, election activity for those State legislators favoring the ratification of the Federal prohibition amendment, contributions to the campaign fund, educational campaigns, cooperation with friendly associations and societies of different denominations, the aid of State W. C. T. U. papers for national prohibition; and close cooperation with the government in its war measures, especially by the circulation of war-time pledges, thereby helping the cause of abstinence from alcoholic liquors at a critical period in the nation's history. A large gain in membership was re-

ported, thirty-two States having met the test of net gain. The National Committee on Patriotic Service was very active during the year in furthering nation-wide prohibition as a war measure, grouping its activities in ten divisions and working according to a carefully arranged and comprehensive programme. In her address before the convention Anna A. Gordon, the president, stated that the prohibition honor roll of 1917 included the District of Columbia, Indiana, Utah, New Hampshire, New Mexico, Alaska, and Porto Rico. The officers for 1917 were: President, Anna A. Gordon; corresponding secretary, Frances P. Parks; recording secretary, Elizabeth P. Anderson; treasurer, Margaret C. Munna.

**WOMAN'S PEACE PARTY.** See INTERNATIONAL PEACE AND ARBITRATION.

**WOMAN SUFFRAGE.** While the war effectually checked some movements for social reform and reconstruction, it has greatly expedited others. Among the latter none seems to have benefited more than the demand for extension of the franchise to women. This result was due in a general way to the very widespread advance of democratic movements throughout western nations; votes for women constitute an important step toward more complete political democracy. But it has been due more specifically, especially in Canada and England, to the great part women have played in the war. In this country some importance also must be attached to the open and honest espousal of the cause by numerous men of prominence and the more perfect generalship of the Woman Suffrage Party; the latter's leaders learned lessons from every defeat and were skillful in adopting the methods of successful campaign managers.

The notable achievements in the United States were the accession of New York to the list of equal suffrage States and the advancement of the amendment to the Federal Constitution. The equal suffrage States are as follows: Wyoming (1869); Colorado (1893); Utah and Idaho (1896); Washington (1910); California (1911); Oregon, Arizona, and Kansas (1912); Alaska (1913); Montana and Nevada (1914); New York (1917). In addition partial voting privileges are had in seventeen other States, seven of which, as indicated below, granted privileges in 1917.

Outside the United States the progress was even more marked. In Great Britain the enfranchisement of 6,000,000 women was all but completed. In Canada every province but Quebec gave votes to women (see CANADA). In France the Chamber of Deputies favored bestowing the municipal franchise on women. In Russia the revolutionary parties favored equal suffrage rights for men and women. In Finland twenty-four women elected in 1916 to the Diet exercised their privileges in 1917. In Norway women not only received extended voting rights, but were made eligible for election to public offices. In Denmark women in 1917 for the first time voted on an important question of state policy, namely, the cession of the Danish West Indies to the United States. In several Swiss Cantons suffrage laws were proposed and discussed in 1917. In Sweden, where the municipal suffrage is already possessed, the agitation for full voting rights continued. Even in Italy, Austria, Hungary, and the South American republics

there were evidences of increased discussion.

**FEDERAL AMENDMENT.** In December, 1915, was introduced in both Houses of Congress the so-called Susan B. Anthony amendment to the Constitution. This would grant full and equal suffrage to women by adding to the Fifteenth Amendment which prohibits the infringement of the right to vote "on account of race, color, or previous condition of servitude" the words "or sex." In order to become effective this amendment must be approved by a two-thirds vote in each House of Congress and by majority votes in the legislatures of three-fourths of the States. It is provided that if a State legislature votes against the amendment it may reconsider its vote, but if it votes in favor it may not reconsider. On September 15, Senator Jones of New Mexico, chairman of the Senate Committee on Woman Suffrage, reported favorably on the amendment. In the House the Rules Committee voted in favor of the establishment of a committee on woman suffrage; and on September 24 this was done by a vote of 181 to 107. On the convening of Congress in December efforts were made to prevent the reference of the amendment to this committee but on the eighteenth by a two-thirds vote this was done. It was also agreed by the Committee on Rules that the matter should be brought to a vote on January 18, 1918. This resulted in 274 votes for to 136 against the amendment. The Democrats cast 104 votes for and 102 against; the Republicans 165 for and 33 against; there were 5 scattered votes for and 1 against.

A sensational feature of the year was the arrest of the so-called "picketers" near the White House who carried banners upbraiding the president for not supporting the amendment.

**NEW YORK.** The most conspicuous American achievement was the outcome of the popular referendum in New York State. By a vote of 674,006 in favor to 585,016 against, the men of New York State granted equal suffrage to women, after a campaign of unprecedented keenness and interest. The New York State Woman Suffrage Party and its sympathizers organized supporters in every county and prepared thoroughly to utilize every advantage known to experienced political campaigners. Among other evidences of this was a petition for the vote signed by 993,152 women. Even before the actual campaign was fully under way they had secured the open and often hearty support of public men who not long previously had been lukewarm or entirely indifferent. True to his principle that the determination of qualifications for the suffrage should be left to the States, President Wilson wrote to Mrs. Whitehouse, head of the New York Suffrage Party, expressing his hope that the voters "would rally to the support of woman suffrage by a handsome majority." Many public men lent their support as did also various papers, although the opposition was strenuous and determined. An interesting feature was the great predominance of votes in favor in New York City, and in the cities generally. Thus, New York County gave 122,300 votes for to 85,500 against; Kings County gave 123,100 for to 89,100 against.

**OTHER AMERICAN LEGISLATION.** The most important other legislation in the United States included the extension of the presidential suffrage to the women of Michigan, Nebraska, North Dakota, and Rhode Island. Presidential

suffrage had been possessed by women in Illinois since 1913, so that altogether at the close of 1917 they had this right in 5 States besides the 12 equal suffrage States. Women thus possessed a voice in the choice of 169 out of 531 presidential electors. Arkansas women were given the privilege of voting at presidential primaries. Presidential suffrage was granted by the legislatures of Indiana and Ohio, but the privilege was revoked in the former State by a decision of the Supreme Court, and in the latter was taken away by popular referendum in November. The vote in Ohio was 265,425 for and 379,779 against. Although one-third of the counties cast a majority in favor, the vote in Hamilton County (Cincinnati) was only 23,170 for to 80,933 against and in Cuyahoga County (Cleveland) 41,765 in favor to 59,949 against. This action of Ohio was offset by that of North Dakota in granting the presidential suffrage by legislative act although a suffrage amendment to the State constitution had been defeated by a majority of nearly 90,000 in the 1914 election. In Arkansas, Nebraska, and North Dakota women were granted full municipal suffrage, while in Florida, Ohio, and Tennessee they were granted the municipal suffrage in certain cities. Especial importance was attached to the achievement in New York and Rhode Island, because these States border upon the Atlantic and represent strongholds of traditional opposition to the political privileges of the feminine sex. In Maine an equal suffrage amendment was rejected by a vote of 20,604 in favor to 38,838 against.

On September 13 the Senate passed a bill extending the suffrage to women in Hawaii having property and the general qualification required of men as to age, residence, etc. The bill also authorized the Hawaiian legislature to grant equal suffrage to women.

**GREAT BRITAIN.** Early in February the report of the Parliamentary Committee on Electoral Reform favored granting the vote to women. This proposal was under debate in the House of Commons in March and April. David Lloyd George was strongly in favor, asserting that in view of woman's multifarious services during the war it would be inequitable, unjust, and ungrateful not to give them a voice in post-war policies. Ex-Premier Asquith, who had stubbornly resisted the assaults of the suffragists a few years earlier, announced his complete change of view in these words: "Wherever one turns, women may be seen, who, without detriment to the prerogatives of their sex, are performing work which, three years ago, would have been regarded as falling exclusively within the province of man; hence, after the war, a readjustment must take place in which women shall have as clear a right to speak as have men." Similar views were expressed by other leaders, including Andrew Bonar Law, head of the Unionist Party. The bill provided that women of at least thirty years of age and meeting the qualifications required of men for registration as Parliamentary electors shall be entitled to registration as such and to vote in the districts in which they reside. Marriage shall be no bar. The purpose of the age limitation was to prevent women from constituting the majority of voters; adult women even before the war outnumbered adult men. The vote in the House of Commons on June 19 was 385 in favor to 55 opposed. The bill was passed by

the House of Lords on January 10, 1918, by a vote of 134 to 69.

**WOMEN IN INDUSTRY.** The most important aspects of the industrial employment of women in 1917 related to the extension of their activities and problems of health and morals due to war-time conditions. From every industrial nation, including Japan, and from many still predominantly agricultural, including Russia and South American republics, came reports of the increased employment of women. This was due in belligerent countries both to the drafting of men and to the extraordinary pressure of war demands, and elsewhere to the latter cause. As in the case of child labor and labor in general there was a tendency to relax restrictions as to hours and conditions so as to increase output (see **CHILD LABOR**; and **LABOR**). This met with strenuous opposition from welfare workers; moreover, considerable publicity was given to scientific inquiries as to the relation of the length of the working day and of rest periods to output, especially studies made by the British Munitions Ministry, all of which showed that the ten and twelve-hour day were in the long run less efficient than the eight-hour day. Women were made to rejoice by the upholding of minimum-wage (q.v.) laws as constitutional; by the activities of National Woman's Trade Union League (see **TRADE UNIONS**), National Consumers' League, and various bodies seeking to protect women war workers.

**UNITED STATES.** In this country women were drawn in greatly increased numbers into many occupations, notably agriculture, munitions plants, street transportation, and elevator service. They replaced many men in clerical positions and office work of all kinds. The Federal government made a national demand for women stenographers and typewriters, utilizing State and city civil service lists and advertising in papers, magazines, and street cars. Special efforts were made in many places, especially in Connecticut, New Jersey, New York, and Delaware to recruit women for farm and truck garden work. Seven large railways began training women as car cleaners, ticket agents, and for other positions. Factories generally enlarged their utilization of female labor.

Many organizations sought to protect women from the increased sweating and hardships of war-time industrial pressure. In the clothing industry at New York and other centres the National Consumers' League found more housework than usual on account of army contracts and yet wages were very low. In spite of government orders against the practice subcontractors engaged house workers on khaki clothing at rates that gave the worker \$3.60 for a twelve-hour day less the cost of thread. Flag making was attended by similar conditions. Hence, widespread demand for increased inspection. Coöperation was effected between the Federal Department of Labor and the Bureau of Registration and Information of the National League for Women's Service looking to a survey of industrial demands and conditions. On June 18 a conference was held by Secretary of Labor Wilson with representatives of this bureau, the Committee on Labor of the Advisory Commission of the Council of National Defense (Samuel Gompers, chairman), the subcommittee on Women in Industry (Mrs. J. Borden Harriman, chairman) of the Gom-

pers' Committee, the Women's Committee of the Advisory Commission of the Council of National Defense (Mrs. Anna Howard Shaw, chairman), and the National Woman's Trade Union League. Plans were begun to protect, as to hours, wages, sanitary conditions, moral surroundings, travel, and lodging, the thousands of women being drawn into industries related to war.

**Bureau of Printing and Engraving.** The pressure of government work at the Bureau of Printing and Engraving led to much overtime for its 4000 employees, most of them women. Complaints by numerous organizations to the director and to Secretary McAdoo were followed by a statement of facts collected by Representative Jeanette Rankin and steps by her for a congressional inquiry. Thereupon the secretary of the treasury appointed a committee to investigate. This found the nine-hour day the rule; and twelve to thirteen hours frequent. The eight-hour day was at once restored and effort made to secure a better distribution of work.

**Kansas and Wisconsin.** On July 28 the Kansas Industrial Welfare Commission established by decree a nine-hour day for women in mercantile establishments. After hearings and investigations, the Wisconsin Industrial Commission issued a decree, June 29, effective August 1, forbidding night work by women in factories and laundries between 6 P. M. and 6 A. M.; and restricting to eight per day and forty-eight per week women's work in mechanical and mercantile establishments, telephone and telegraph offices, restaurants, and transportation when such women work more than one night per week after 6:30 P. M.

**Legislation.** The Illinois legislature created a commission of five to consist of one representative of women workers, one employer of women, a social worker, and two physicians, to investigate conditions of woman's labor, especially hours. North Dakota created a public welfare commission to investigate "economic, moral, and social conditions of women, girl, and child workers" in factories, hotels, and elsewhere. Its report must include average wages of women and children in industry. Vermont extended its prohibition of the employment of women two weeks before or four weeks after child birth to mills, canneries, workshops, and factories; it formerly included only manufacturing or mechanical establishments. Delaware required the provision of suitable lunchrooms free from dust and fumes in establishments employing women where there are poisonous fumes, gases, or dusts; and required such places to install and operate exhaust fans. It also required all mercantile or manufacturing establishments, restaurants, hotels, offices, places of amusement, telephone and telegraph offices, employing women to provide 250 cubic feet of air for each person in each work room, and to properly heat, light, and clean such rooms and adjoining halls and stairways; clean water and sanitary fountains or individual cups must be provided free of charge for ice or water; also proper water closets suitably lighted, ventilated, screened, and cleaned; finally one seat for each three women for rest in the work room, and, where female employees must change clothing, dressing rooms with lockers or separate hooks are required. Montana required the installation of seats for women workers with permission to use them when not actively employed.

Rhode Island required the provision of separate dressing rooms for women at the discretion of the factory inspector, and seats for women to be available when duties permit. See also **LABOR LEGISLATION; CHILD LABOR; and MINIMUM WAGE.**

**GREAT BRITAIN.** In the Board of Trade *Labour Gazette* for August were given figures comparing the number of women employed in different occupations in July, 1914, and April, 1917, as follows:

Occupation	Females Employed in July, 1914	Increase (+) or Decrease (—) in the Employment of Females, July, 1914, to April, 1917	
		Number	Per Cent
Industries .....	2,184,000	+ 453,000	+ 20.7
Government establishments .....	2,000	+ 198,000	+ 9,404.9
Transport .....	19,000	+ 62,000	+ 325.4
Finance and banking .....	9,500	+ 50,000	+ 526.2
Commerce .....	496,000	+ 807,000	+ 61.9
Professions .....	67,500	+ 21,000	+ 31.2
Hotels, public houses, cinemas, theatres, etc. .	176,000	+ 13,000	+ 7.4
Civil service.....	66,000	+ 89,000	+ 184.9
Local government	198,000	+ 47,000	+ 28.9
Total.....	3,218,000	+ 1,240,000	+ 37.6

Thus, since the war started, nearly one million and a quarter females had been added to the labor force of Great Britain. These figures, moreover, did not include casual agricultural laborers, domestic servants, and women employed in small shops or in military, naval, and Red Cross hospitals. It was known, however, that the number employed in these hospitals had increased by 36,000. On the other hand, female casual farm laborers had decreased by 13,000 and workers in small shops and domestic service were about 300,000 fewer. There thus appeared to be a net increase of 963,000 women workers. Moreover, the rate of the increase in the number of women workers was in all main groups accelerating. Thus in the first quarter of 1917 the increase was 54,000 as compared with 26,000 the preceding quarter. The metal trades alone had absorbed 41,000 of the increase from January to April, 1917, and the chemical trades 8000. Of the 453,000 drawn into various industries, as shown in the above table, 308,000 had gone into various branches of the metal trades; 51,000 into chemical trades; 22,000 into textiles; 24,000 into wood-working, and 18,000 into food industries; on the other hand, there was a decrease of 37,000 in the clothing trades and of 7000 in the paper and printing trades. The high wages paid in the metal and chemical industries had diverted labor from clothing and printing and had retarded their movement into the textile trades so that in April, 1917, 38 per cent of the firms in textiles reported a shortage of female labor; 23 per cent of the firms in clothing and 17 per cent of those in paper and printing likewise reported a shortage of women workers. It was estimated that the total number of men replaced by women from July, 1914, to April, 1917, was 1,256,000.

In August the ministry of munitions announced advances in wages for all females employed in munitions establishments. The women of 18 years of age and over received an increase

of 2s. 6d. (61 cents) per week and girls under 18 an advance of 1s. 3d. (30 cents) per week. The advances applied to the controlled establishments in Ireland as well as in Great Britain. These advances were made necessary by the increasing cost of living. Weekly wages of the women munition workers ranged from 22s. 6d. (\$5.47) as a minimum up to £4 or £5 in exceptional cases. Owing to the increase in prices the purchasing value of a pound had fallen from \$4.87 in 1914 to \$3.53 by the middle of 1917. It was also announced that tribunals for the hearing of claims for increases in wages would be established for women munition workers.

**British Women Police.** A significant English development was the rapid increase in the number of police women. In the London police department force a new bureau of women police was created in 1914 under Damer Dawson; by 1917 this had over 300 members. This plan was adopted in other centres, including Grantham, Hull, Folkestone, Birmingham, Wimbledon, and Richmond. The great service of these women was in the protection of girls in places where soldiers were numerous. Industrial concerns also created women police forces for their plants; in some of the large munitions establishments with thousands of women workers the number of police women ranged from 40 to 120, both for service within plants and for oversight of women's lodgings, boarding houses, and travel.

**GERMANY.** As in other warring countries women were drawn into a multitude of new industrial pursuits in large numbers. There was probably no line of industrial effort in which women were not to be found and in all of the more common occupations their numbers became astonishingly great. Thus, while in 1914 only 7265 women were employed in German mines by the close of 1916, 37,560 were thus employed. During the same period the number of young persons employed in mines rose from 31,290 to 43,095. The percentage of women to all mine employees increased from 0.94 at the middle of 1914 to 6.51 late in 1916, and the percentage of young persons rose from 4.08 to 7.46. The wages per shift rose from 29.9 cents at the middle of 1914 to 47.3 cents late in 1916 for women workers in the mines of Upper Silesia; in the Ruhr Basin the increase was from 57.9 cents to 85.3 cents. These increases were far less than the rise in prices.

**FRANCE.** French women were drawn into nearly every line of trade, transportation, commerce, and industry. Branches of bread making and biscuit baking from which they previously were excluded came to be dominated by them. They were employed in all branches of food preserving; in the manufacture of sugar they served as strainers, filterers, diffusers, knife sharpeners, truck movers, and various kinds of machine tenders. They were employed in starch and glucose factories and the wine-making industry was very largely dependent upon them. They were to be found doing work previously monopolized by men on steam and electric railways, in numerous kinds of manufacturing, on farms, and in shops and offices.

A delegation of French working women visited England to study factory conditions and methods. It strongly recommended the introduction of British methods of caring for health and comfort and the appointment of women overseers. The French ministries of labor and

munitions promised to form a national council of women to assist in such reforms. A school was opened in Paris to instruct women superintendents. Many bodies, especially medical societies and women's organizations, actively sought to improve the safeguards of female laborers, especially of pregnant women and young mothers. In consequence, the ministry of labor issued various sanitary regulations and other restrictions.

#### **WOMEN'S CLUBS, GENERAL FEDERATION OF.**

The federation was organized in 1889 in New York City. Its conventions and reports are biennial, the last convention having been held in New York City, May 24-June 1, 1916. In 1917 some 2100 clubs were members of the federation. They are to be found practically in every State in the union and even in Alaska and the Canal Zone. The following are the officers for 1916-18: President, Mrs. Josiah Evans Cowles, Los Angeles, Cal.; first vice-president, Miss Georgie A. Bacon, Worcester, Mass.; second vice-president, Mrs. Eugene Reilly; recording secretary, Mrs. W. I. McFarland, Wagner, S. Dak.; corresponding secretary, Mrs. Francis D. Everett, Highland Park, Ill.; treasurer, Mrs. William B. Young, Jacksonville, Fla.; auditor, Mrs. William P. Harper, Seattle, Wash.; manager of the bureau of information, Mrs. Mary I. **WOOL.** See **STOCK RAISING**.

**WORCESTER MUSIC FESTIVAL.** See **MUSIC, Festivals**.

#### **WORCESTER POLYTECHNIC INSTITUTE.**

A non-sectarian institution for the technical education of men at Worcester, Mass. In the fall of 1917 there were 425 students and 44 members of the faculty; 350 students, alumni, and members of the faculty were in government service at the end of the year. The library contained 15,358 volumes. Productive funds in 1917 amounted to \$945,204 and the income therefrom to \$43,079. Benefactions to the amount of \$26,500 were received in 1917. The institute was founded in 1865. President, Ira N. Hollis.

**WORKMEN'S COMPENSATION.** The most extensive movement in the field of labor legislation in the United States in recent years has been the enactment by 37 States, 3 Territories, and the Federal government of workmen's com-

pensation laws. These replace the old system of employer's liability by systems of more or less definite compensation for industrial accidents, and often also for occupational diseases, without the necessity of a suit at law. Based on the principle that risks to health and life and limb are inevitable, and that the burden should rest upon industry rather than upon the victims of industrial accident or condition, these laws aim through the careful administrative supervision of State commissions to proportion the compensation received by the injured worker to the severity of the injury. The legislation in 1917 was not extensive. There was, however, as indicated below, considerable attention given to the administrative problems connected with workmen's compensation; and action was taken by the Federal government to provide compensation for all persons in the military or naval service of the United States. In addition, a decision of the United States Supreme Court handed down March 6 upheld the constitutionality of the compensation laws of Iowa, New York, and Washington.

**THE INTERNATIONAL ASSOCIATION OF INDUSTRIAL ACCIDENT BOARDS AND COMMISSIONS** met at Boston, August 21-25, for its fourth annual session. Representatives were present from 15 States, 4 provinces of Canada, the United States Employees' Compensation Commission, and the Federal Bureau of Labor Statistics. The following fundamental problems of workmen's compensation were discussed: prevention of accidents and disease; care and cure of the injured worker; reeducation and adaptation to new industrial conditions; and the administration of compensation benefits. Among the resolutions adopted was one requesting the appointment of a committee to formulate and promote legislation eliminating the conflicts in jurisdiction of Federal and State authorities in industrial accident cases occurring in transportation and kindred occupations. Another resolution endorsed "every wise effort to rehabilitate those injured in industry and also those injured in military service." The next convention will meet at Madison, Wis., with F. M. Wilcox, of the Wisconsin Industrial Commission, as president.

As summarized in the *Monthly Review* of the Bureau of Labor Statistics the papers read at this convention advanced materially understanding of problems relating to prevention, the restoration of the injured workers, and "free choice" in the selection of physicians. With reference to accident prevention it was shown that a few years ago, in view of the fact that most accidents result from the carelessness of workers, it was believed that there must be always a large residuum of inevitable accidents. There followed a campaign for the introduction of safety devices, for the enactment of safety laws, and for safety education. Experience has shown that accidents resulting from mechanical causes are much more severe than those due to workers' negligence. While mechanical accidents constitute only one-fourth of all, they are responsible for 50 per cent of time lost. Experience has also shown that the results of education have been limited almost entirely to a reduction of accidents from non-mechanical causes, or those resulting in short-time losses. Consequently, the present problem of accident prevention is one of safety engineering, under which is included such large problems as the

design and location of buildings and transportation facilities, means of exit, and entrance to all parts of factories, sufficient lighting, protection of dangerous machines, and similar matters.

The cure and industrial rehabilitation of the worker requires (1) medical and surgical attention, (2) proper equipment and instruction in the use of artificial appliances to remedy the loss of hands, feet, fingers, or other bodily part, (3) education in some new industrial adaptation, and (4) compensation during the period of cure and reeducation. Only the first of these problems has been met with any adequacy. It was pointed out that Canada has developed facilities for meeting all of these four needs in the case of injured soldiers. The Military Hospitals' Commission provides treatment in convalescent homes and vocational instruction, while the Board of Pension Commissioners furnishes gratuities and financial assistance, and in each Province are commissions for securing employment (see below).

The free choice of physician is a thorny problem which has occasioned much dispute and dissatisfaction. Most of the State laws give the employer the responsibility of providing reasonable medical and hospital care; and this is believed to carry the privilege of choosing the physician. Latterly the movement to permit employees to choose their own physician has gained momentum. In favor of selection by the employer it is argued that he is more capable of judging the efficiency of a physician than the employee; that immigrants will otherwise be frequently victimized by quack practitioners of their own race; that many large establishments maintain hospitals of their own which insure the best of treatment and the closest medical supervision. On the other hand, in favor of selection of the physician by the employee, it is argued that the medical relationship is distinctly private and personal; that best therapeutic results require confidence in the practitioner; that the injured worker has most at stake; that the frequent practice of employing a physician on a contract basis has resulted in injured employees receiving inadequate attention; that consequently employees frequently return to work before restored to full health. The physicians themselves have been much dissatisfied with the practices arising under the compensation laws. The extensive use of hospitals with charity patients has deprived the physicians of a legitimate source of income. On the other hand, it has been argued that physicians with low standards have padded their bills. The solution of these difficulties seems likely to be reached through the formation of panels of competent and experienced physicians from which the employee will have the privilege of choosing a physician.

The Committee on Statistics of the Association presented at the Boston meeting the results of its inquiries as to the relative severity of different injuries. It is evident that the importance of an injury may be measured less accurately by its frequency than by the loss of time occasioned by it. On this basis this committee, using more or less arbitrariness, found the relative importance of certain injuries on a scale of 100 to be: death, 100; total permanent disability, 100; arm above elbow, dismemberment, 75; permanent disability of thumb, 10;

loss of one eye, 30, and both eyes, 100; etc. The Bureau of Labor Statistics prepared a similar severity scale for its own use in reports on *Accidents and Accident Prevention* in the machine building and the iron and steel trades (Bulletins 216 and 234).

THE NATIONAL SAFETY COUNCIL held its sixth congress in New York City during the week of September 9. At the same time it carried on an exhibit of safety devices and methods in connection with the American Museum of Safety at the Grand Central Palace.

**CONSTITUTIONALITY.** As indicated above, the constitutionality of workmen's compensation laws was upheld by the Supreme Court on March 6 in a comprehensive decision approving three of the leading types of such laws. The Iowa law was elective: gave both employer and employee the option of accepting its provision or retaining the older system of employer's liability. It, however, sought to influence both to come under the new law by removing the traditional "defenses" of the employer and by offering to the employee definitely assured compensation in place of the uncertainties of legal prosecutions. In approving this law the Supreme Court virtually approved the majority of compensation laws in the country.

The New York and Washington laws were both compulsory, but the New York law, which was enacted after the State constitution was especially amended, is limited in its scope to "hazardous occupations." The Washington law is more extensive and thoroughgoing, covering all employments except agriculture and domestic service, excluding private casualty companies, and requiring employers to insure in a State fund. In the case of this law the decision was 5 to 4.

**LEGISLATION.** During 1917 the States of New Mexico, New Jersey, Delaware, Utah, Idaho, and South Dakota were added to the list of States replacing the old system of employers' liability by the new system of workmen's compensation. There were thus 37 States, the Territories of Alaska and Hawaii, Porto Rico, and the Federal government included under jurisdiction of compensation laws. Besides these new laws the statutes in 24 States were amended and supplementary laws enacted in two others, besides a new law regarding maritime injuries enacted by Congress. Only the general nature of this vast mass of legislation can be here indicated. All the new legislation with a few minor exceptions enlarges the scope of previous laws and makes more generous their provisions. California and Hawaii broadened their laws to cover occupational diseases. Illinois made its law compulsory instead of elective; but Nevada substituted active election for presumed election. Indiana excluded railroad train service from its law; Washington did likewise except railway construction work which is placed under such law as Congress may enact; these actions were designed to give Congress a freer hand. Numerous limitations were removed: Iowa struck out the clause limiting industries covered to those carried on "for pecuniary gain"; requirements as to number of employees necessary to bring the establishment under the law were reduced in Texas, Nebraska, Wyoming, and Wisconsin. New York, Texas, and Wyoming extended the list of employments enumerated, as did also Oregon and Rhode Island. Vermont in-

cluded all employees earning under \$2000 in place of all earning under \$1500 as previously. The waiting time intervening between the injury and beginning of compensation was reduced in California, Connecticut, Hawaii, Indiana, Kansas, Minnesota, Nebraska, Vermont, and Washington. In Nebraska, New York, Rhode Island, Washington, Wisconsin, and Wyoming a provision was inserted authorizing the payment of compensation from the time of injury in the case of more serious accidents; this was due to the realization that the waiting time between injury and compensation was intended to do away with malingering and the seeking of benefits for trivial injuries, a motive not existing in the case of serious accidents. As regards beneficiaries the Alaska statute was made to include posthumous children, and children beyond age 16 in case of physical and mental incompetence; Nevada extended the age to which compensation is allowable from 16 to 18 years. In numerous States the provisions with reference to burial allowances were changed, most of them in the direction of increased allowances. Similarly with reference to medical, surgical, and nursing aid more liberal provisions were passed in California, Hawaii, Iowa, Kansas, Nevada, Rhode Island, Texas, Vermont, Washington, and Wisconsin.

Financial benefits were also increased: Connecticut raised the maximum in case of disability or death from \$10 to \$14 per week, as did also Massachusetts in case of total disability; Illinois advanced maximum death benefits from \$2400 to \$4000 and maximum percentage allowance for disability from 50 per cent to 65 per cent of wages. In Iowa the minimum and maximum payments for disability were raised from \$5 and \$10 respectively to \$6 and \$15 per week. Kansas increased the allowance for disability from 50 per cent to 60 per cent of wages, raised the minimum death benefit from \$1200 to \$1400 and the maximum from \$3600 to \$3800. Changes similar to the foregoing but differing in details were made in Minnesota, Nebraska, Nevada, Ohio, Vermont, and Wyoming. In several States specific schedules of compensation for differing periods and specified injuries were inserted, thus showing a tendency to remove more aspects of compensation from the discretionary action of compensation commissions. California, Nebraska, and New Jersey required all employers to insure themselves against risk, unless they prove their ability to carry their own risks; Pennsylvania required contracts with State or local governments to insure their employees under the State Compensation Law. As regards administration, Minnesota created a board to exercise certain advisory functions as to the insurance features of the law, and an investigative board to propose needed amendments; Nebraska placed administration in charge of a division of the Bureau of Labor; Vermont abolished its industrial accident board and gave administrative authority to one man to be known as the commissioner of industries; Washington provided for the creation of local aid boards to consist of one representative of employers and one of workmen, and created a State Medical Aid Board to establish rules and practices for the care and treatment of injured workmen.

**MARITIME INJURIES.** On May 21 the Supreme

Court of the United States decided two compensation cases growing out of injuries in New York harbor. Similar cases had been decided by the State courts of California, Connecticut, and Minnesota in harmony with the views of the New York courts. These cases grew out of injuries to stevedores unloading at New York vessels engaged in Atlantic coast trade. The New York Compensation Commission awarded injuries under the State law. The Southern Pacific Company in one case brought suit to obviate the payment of compensation on the ground that the injuries having arisen in interstate commerce the case was not under State jurisdiction. The action of the commission was upheld by the New York courts, partly on the ground that there was no Federal legislation applicable to the case. The United States Supreme Court agreed that no Federal legislation was applicable, but also declared that the State law was not applicable because admiralty jurisdiction is conferred by the constitution upon the courts of the United States. The decision held that longshore work is maritime in nature and that "the rights and liabilities of the parts in connection therewith were matters clearly within admiralty jurisdiction." Justices Holmes, Pitney, Brandeis, and Clarke dissented mainly on the ground that industrial injuries should be dealt with by common-law remedies and that common-law jurisdiction remained with the State courts.

Following the above decision Senator Johnson of California introduced in Congress in September a bill designed to transfer to the States the control of such cases or at least to give the State courts concurrent jurisdiction. The bill was approved by the president on October 6. As passed the law gives claimants the right to seek compensation under the laws of any State in case of such maritime injuries though not excluding resort to Federal courts of admiralty and maritime jurisdiction.

**GOVERNMENT WAR COMPENSATION.** The war risk insurance authorized in September, 1914, by Congress applied only to American vessels in foreign trade and their cargoes. Up to June 30, 1917, this insurance resulted in net losses to the government of \$10,176,000. It was argued that if the government could insure sea-going property in foreign commerce it should similarly insure sea-faring men engaged in this same trade. Private insurance companies could not risk such insurance and many seamen refused to engage on foreign-trade vessels without insurance. Consequently in June Congress passed an amendment, approved by the president, June 12, to the act of September, 1914, whereby the Bureau of War Risk Insurance was authorized to provide insurance for masters, officers, and crews of American merchant vessels against loss of life or personal injury on account of risks of war and to provide for compensation during detention following capture by enemies of the United States. The act authorized compensation in case of death, permanent total disability, or loss of both hands, both arms, both feet, both legs, both eyes; or any two of them amounting to one year's earnings or 12 times the monthly earnings, but not less than \$1500 nor more than \$5000. The following compensations were also specified: one hand, 50 per cent of a year's earnings; one arm, 65 per cent; one foot, 50 per cent; one leg, 65 per

cent; one eye, 45 per cent; and total loss of hearing, 50 per cent. In case of detention by an enemy, compensation should be at the same rate as the earnings previous to capture. A division of marine and seamen's insurance was organized in the Bureau of War Risk Insurance for the issuance of policies on the lives of masters, officers, and crews.

Finally the act of October 6 provided for family allotments and allowances, extended the above compensation idea to all soldiers and sailors, and set up a plan of government insurance (see *INSURANCE* for this plan). The compensation sections of this act covered death or disability of all persons employed in active military or naval service, including the women in the army and the navy nurse corps. In case of death compensations range from \$20 for one motherless child or widowed mother and \$25 for a childless widow to a maximum per month of \$57.50 for a widow with four or more children. For injuries compensations were graded according to severity and number of dependents.

**CANADA.** As early as September 1, 1914, Canada put into operation a scale of compensations for militiamen wounded or disabled while in active service, as also a pension system for the dependents of those killed. The compensations were graded according to the severity of the injury and rank in the service ranging in the original plan from \$75 per year for a man in the ranks slightly injured to \$2100 for a brigadier general totally incapacitated for earning a livelihood. Later the plan was modified so as to provide 10 classes and compensations ranging from \$480 per year in case of total disability of the common soldier to \$2700 a year in case of a brigadier general. In case of death widows of common soldiers receive an allowance of \$22 per month plus \$5 per month for each child. These pensions graded upward through various ranks being \$45 for the widow of a captain plus \$7 for each child; \$50 for the wife of a major plus \$8 for each child; and culminating in \$100 for the widow of a brigadier general plus \$10 for each child. These compensations were in addition to the grants by the Canadian government to the dependents of soldiers as a "separation allowance," as follows: privates, \$20 per month; sergeants, \$25; captains, \$40; lieutenant colonels, \$60; etc. In addition the Canadian Patriotic Fund, organized in August, 1914, and securing funds from private sources, made "separation allowances" ranging from \$5 in case of needy wife with no children to \$30 per month in the case of a needy woman with 7 or more children. The Canadian system, besides the insurance described under *INSURANCE* (q.v.), also included the activities of the Military Hospitals Commission charged with the cure, vocational training, and general rehabilitation of injured soldiers.

**NEW SOUTH WALES.** A new compensation act became effective on July 1, 1917. It requires every employer or his legal representative to make provision for accident compensation. All employees, including clerks, typists, messengers, and domestic servants, besides all manual workers, are included within the law, with the following exceptions: (1) Any person earning more than \$1618 per year; and (2) casual workers. Compensation in case of death ranges from \$1460 to \$2435, an average increase of

\$500 over the previous law. For permanent disability by accidents or disease the compensation is \$3650; for temporary total or partial disability weekly payments equal to one-half wages, but not exceeding \$9.75 per week nor more than \$3650 in total.

**GREAT BRITAIN.** The Workmen's Compensation (War Addition) Act became effective September 1 and will remain in force until 6 months after the cessation of the war. As its title implies the purpose of the act is to increase compensations for injuries during the war period. It requires the payment of benefits 25 per cent greater than those allowed under the Compensation Act of 1906 to every employee suffering total disability as a result of an industrial accident. Such compensation is to be paid to all employees thus incapacitated on or after September 1, 1917, whether the accident resulting in their disability occurred before or after that date.

**WORLD'S CROPS.** See *AGRICULTURE*.

**WRESTLING.** The winners of the Amateur Athletic Union wrestling championships, held at Atlantic City, N. J., were: 108-pound class, Carl Benson, Swedish-American A. C.; 115-pound class, Louis J. Servais, University of Pennsylvania; 125-pound class, Carl Liljehult, Bronx Church House, New York City; 135-pound class, Peter Metropoulos, Gary (Ind.) Y. M. C. A.; 145-pound class, Harry Jenkins, Pittsburgh A. A.; 158-pound class, Charles Johnson, Swedish G. A. P., Boston; 175-pound class, Dexter Very, Pittsburgh A. A.; heavy-weight class, Dexter Very, Pittsburgh A. A.

Cornell for the fifth year in succession won the intercollegiate championship with the University of Pennsylvania and Lehigh University tied for second place. The winners of the various bouts were: 115-pound class, Servais, Pennsylvania; 125-pound class, Wigsten, Cornell; 135-pound class, Kaiser, Pennsylvania; 145-pound class, Post, Cornell; 158-pound class, Sager, Cornell; 175-pound class, Zepp, Cornell; heavyweight, Bard, Cornell.

Many professional bouts were held throughout the United States during the year, the season closing with a long tournament at the Lexington Theatre, New York City, which ended with Wladek Zbyszko and Ed (Strangler) Lewis each claiming the championship of the world. Each of these wrestlers had little difficulty in disposing of their opponents. Lewis threw Zbyszko in a bout where the former's famous headlock was permitted but was thrown by Zbyszko in a match where this hold was barred.

The death of Frank A. Gotch, the undefeated heavyweight champion of the world, occurred in 1917.

**WRIGHT, HAMILTON.** An American physician and pathologist, known chiefly for his campaign against narcotics, died in Washington, D. C., January 9, 1917. He was born in Cleveland, Ohio, in 1867. Immediately upon graduating from the medical department of McGill University, he spent a year in studying at first hand tropical conditions of life in China and Japan. Then he became John Lucas Walker exhibitor of Cambridge University, and was appointed assistant director of the London County Laboratories. At this period he spent some time in Heidelberg and other continental universities. The British Government sent him in 1899 to the Malay states to study beriberi and other tropical diseases, and there he remained

for four years, founding an Institute for Medical Research. Several more years of research work, in the United States as honorary fellow of Johns Hopkins, and in Europe, were followed by appointment as American delegate to, and acting chairman of, the International Opium Commission, which met at Shanghai, China, in 1909. Dr. Wright was also prominent in the second and third Opium Conferences at The Hague, in 1913 and 1914. He worked successfully to have the Harrison Narcotic Law and three other similar acts passed, suppressing abuse of narcotics in this country and forbidding citizens of the United States from engaging in trade in narcotics with China. From 1915 till he was injured in a motor accident, he devoted himself to relief work in France. His writings are in the form of papers and monographs.

**WÜRTTEMBERG.** A European kingdom, one of the more important constituent states of the German Empire. The capital is Stuttgart. Württemberg lies between the kingdom of Bavaria on the east and the grand duchy of Baden on the west. The area is 7532 square miles, which is about equal to the land area of New Jersey. The population at the census of December 1, 1910, was 2,437,574, as compared with 2,169,480 in 1900, 2,036,522 in 1890, 1,748,000 in 1864, and 1,411,000 in 1816. The average annual increase from 1816 to 1910 was 0.58 per cent; from 1900 to 1910, 1.16 per cent. In 1910 communes having 2000 or more inhabitants aggregated a population of 1,223,916. Evangelicals numbered 1,671,183 (68.56 per cent); Roman Catholics, 739,995 (30.36); other Christians, 12,863 (0.53 per cent); Jews, 11,982 (0.49 per cent). Württemberg has a bicameral parliament. The lower house consists of 92 deputies elected for six years by direct vote. The king in 1917 was Wilhelm II, who was born in 1848 and succeeded to the throne October 6, 1891.

**WYOMING.. POPULATION.** The population of the State in 1910 was 145,965, and on July 1, 1917, it was estimated to be 184,970.

**AGRICULTURE.** The acreage, production, and value of the principal crops as estimated by the United States Department of Agriculture in 1916-17 were as follows:

		Acreage	Prod. Bu.	Value
Corn .....	1917	33,000	660,000	\$1,155,000
	1916	25,000	550,000	495,000
Wheat .....	1917	198,000	4,200,000	8,412,000
	1916	170,000	3,670,000	5,322,000
Oats .....	1917	268,000	9,468,000	7,574,000
	1916	250,000	8,750,000	5,250,000
Potatoes ...	1917	30,000	4,650,000	4,836,000
	1916	18,000	2,340,000	2,995,000
Hay .....	1917	580,000	a 952,000	16,184,000
	1916	580,000	1,044,000	12,528,000

a Tons.

**MINERAL PRODUCTION.** The coal production in the State in 1916 was 7,910,647 net tons, valued at \$12,239,707, an increase compared with 1915 of 1,356,619 tons, or 21 per cent in quantity, and of \$2,683,903, or 28 per cent in value. The increase is attributed mainly to greater consumption of coal by railroads. The car supply was nearly equal to requirements export in September and October; the supply of labor was short in November and December. The number of men employed in the coal mines

of the State during the year was 7255, compared with 7244 in 1915. There were produced in the State in 1916 6,234,137 barrels of petroleum, valued at \$5,644,080 compared with 4,245,525 barrels in 1915, valued at \$2,217,018, an increase of 47 per cent in quantity, and of 155 per cent in value. The iron ore mined in the State in 1916 amounted to 545,744 gross tons, compared with 434,513 tons in 1915. The total production of gold, silver, and copper in 1916 was \$666,414, as compared with \$93,286 in 1915. Of the total increase of \$573,128 copper contributed \$563,945.

**TRANSPORTATION.** The total railway mileage of the State is about 2000. The roads having the longest mileage are: The Union Pacific, 470; Chicago, Burlington, and Quincy, 236.

**FINANCE.** The report of the State treasurer for the biennial period 1914-16, the latest for which statistics are available, shows a balance on hand, October 1, 1914, of \$718,426. The total receipts amounted to \$3,559,029, and the disbursements to \$2,718,117, leaving a balance on hand, September 1, 1916, of \$1,046,606.

**EDUCATION.** The total school population in 1916 was 41,831. The total enrollment was 36,630, with the average daily attendance of 25,000. The number of male teachers was 253 and the female teachers 1482. The average monthly salary of male teachers was \$85.91, and the salary of female teachers \$61.91. The total expenditure for school purposes was \$1,589,196.

The legislature of 1917 put the State school system under a State Board of Education, with a commissioner as the executive officer. The commissioner is elected by the board. Formerly the State office was under a State superintendent elected by the people. The office still exists in name, but the chief duty of the State superintendent, so far as schools are concerned, is membership on the State Board of Education.

**CHARITIES AND CORRECTIONS.** The charitable and correctional institutions of the State include the State Hospital for the Insane at Evanston, the Wyoming State Penitentiary at Rawlins, the Wyoming Soldiers' and Sailors' Home at Buffalo, the Big Horn Hot Springs Reservation at Thermopolis, the General Hospitals at Sheridan, Rock Spring, and Casper, the Wyoming School for Defectives at Lander, and the Wyoming Industrial School at Warland.

**LEGISLATION.** Among the more important measures passed by the legislative session of 1917 are those noted below:

The laws relating to elections were amended in important particulars. Non-partisan ballots are required for the election of the judiciary and certain school officers. The hours of labor for women are increased from 56 to 60 per week. Measures were passed providing for the regulation and inspection of the sale of gasoline and similar products. Untrue, deceptive, or misleading advertisements are made punishable.

**STATE OFFICERS.** Acting Governor, Frank L. Houx; Secretary of State, Frank L. Houx; Treasurer, Herman B. Gates; Auditor and Commissioner of Insurance, Robert B. Forsyth; Adjutant-General, W. K. Weaver; Attorney-General, D. A. Preston; Superintendent of Public Instruction, Edith K. O. Clark; Houx, Weaver, and Preston, Democrats; others Republicans.

**JUDICIARY.** Supreme Court: Chief Justice,

Chas. N. Potter; Associate Justices, Cyrus Beard, Chas. E. Blydenburgh; Clerk, W. H. Kelly.

**WYOMING, UNIVERSITY OF.** A co-educational State institution at Laramie, Wyoming. In the fall of 1917 there were 300 students and 47 members of the faculty; 77 students and 6 members of the faculty were in government service in 1917. The library contained 40,000 volumes. Productive funds in 1917 amounted to \$110,893, and the income therefrom to \$35,784. A department of music building and a small model rural school for the college of education were erected in 1917. The university was founded in 1887. President C. A. Duniway resigned on September 1, 1917, and Dr. Aven Nelson, professor of botany, was elected acting president for the balance of the academic year.

**X-RAYS.** See PHYSICS.

**YACHTING.** Yachting suffered more perhaps from the war than any other sport, practically no competitions of importance being held during the year. All the leading clubs of the United States abandoned the sport and a large number of the craft were turned over to the Federal government. A few organizations, such as the Seawanhaka-Corinthian, Indian Harbor, and Bayside clubs, held regattas on Saturday afternoons during the season and the New Rochelle Yacht Club staged a series of races in the spring and again in the fall.

*Miss Detroit II* made the best showing of the motor boats in 1917. She won the Gold Cup in the National Power Boat Association race at Minneapolis, averaging 59.6 miles an hour in the first lap of the six-mile course in the final race and establishing a new record. The same boat captured the one-mile championship race by default. *Raven III*, owned by C. Kitchner, was the leader in the distance events, winning both the Miami-Gun Key and Miami-Palm Beach races, the former at 90 miles and the latter 70 miles. All records for hydroplanes were broken by the *Whip-Po-Will*, owned by A. L. Judson, which averaged 69.38 miles an hour in six one-mile trials on Lake George, and covered one mile in 51.55 seconds at the rate of 70.15 miles an hour.

**YALE UNIVERSITY.** A non-sectarian institution of higher learning, at New Haven, Conn. In its graduate schools of art and music it is co-educational. In the fall of 1917 the student enrollment was as follows: Graduate school 220, Yale College 913, Sheffield Scientific School 668, School of Fine Arts 33, School of Music 90, School of Forestry 15, School of Religion 79, School of Medicine 78, School of Law 75. Total, after deducting 42 names inserted twice, 2129. The faculty was made up of 159 professors, including other university officers, 89 assistant professors, 4 lecturers on university foundations, 110 instructors, 199 assistants. Total, 561. Leaves of absence were granted at the beginning of the year to over 40 members of the faculty for war work. Ernest G. Lorenzen, formerly professor at the University of Minnesota, Henry Wesley Dunn of the Boston bar, and Edward M. Borchard of the Library of Congress were added to the staff of the law school. On October 1, 1917, 830 Yale students were in some branch of the government service. It was estimated by the *Yale Alumni Weekly* that over 5000 Yale graduates were tak-

ing part in the war at the end of 1917. The gifts and bequests received included the following: Charles W. Harkness for general purposes \$500,000, Alumni University Fund \$315,461, for an armory building \$84,355, from the estate of Mary Dewitt Jesup \$75,000, for the department of orthopedics from Mrs. E. H. Harriman \$100,000, for the department of obstetrics from Charles F. Brooker \$50,000, for the Albert Arnold Sprague Memorial Hall \$112,574, miscellaneous \$280,000. Total production fund on June 30, 1917—\$19,823,646. Total income at the end of 1917 amounted to \$2,041,704, of which \$1,041,087 was income from investments, \$563,761 from term bills and student charges, \$199,621 from dormitory rents, \$197,230 gifts to income, and \$40,003 from sundries. The whole number of books in the library of the university is about a million, including both bound and unbound volumes. Capt. Winfield Soverton, U. S. A., was appointed professor of military science and tactics, and Rear Admiral Colby M. Chester, U. S. N., was appointed professor of naval science. The university was founded in 1701. President, Arthur Twining Hadley, LL.D.

**YERKES OBSERVATORY.** See ASTRONOMY.

**YOUNG MEN'S CHRISTIAN ASSOCIATION.** The control of this organization is vested in the International Committee of the Young Men's Christian Association, which has its headquarters at 124 East Twenty-eighth Street, New York City. The following statistics are inclusive of May 1, 1917: Number of organizations, 2087; paid officers, 5188; directors and committee forces, 91,155; total membership, 720,468 (7 per cent increase over previous year), of whom 48 per cent are active; total net property and funds paid in, \$97,025,000; contributions toward current expenses, \$4,045,000; total operating expense for regular work of the North American movement—local and supervisory—\$21,105,000; foreign work supervision, \$576,400; for work in connection with the European war and on the Mexican border previous to April 1, 1917, \$1,500,000.

The foreign work, with its 450 employed officers, exceeds that of all preceding years in significance of results sought and obtained. Native trained leaders exceed 300, and with favorable government recognition, the volume of local support is constantly growing.

When the United States entered the war, the association leaders called for \$3,000,000 to provide association service among the enlisted men for the summer of 1917. The public responded to the appeal with \$5,000,000. As a result regular association work was carried on (October, 1917) in 186 camps and 245 other places among enlisted men; 265 buildings have been erected and 111 new buildings authorized; 987 secretaries were at work and 1181 were to be assigned before the end of the year for the National Guard Camps and National Army Cantonnments. In addition 200 secretaries were at work among American troops overseas and this number has been steadily increasing.

So satisfactory has this work been for enlisted men in the army and navy, and so rapidly have its demands been expanded to meet the great need, that the National War Work Council of the Y. M. C. A. called for \$35,000,000 to provide for this service for the nine months from October, 1917, to July, 1918. This call

met with a cordial response of over \$50,000,000, which amount is now making it possible for more than 2000 employed secretaries to serve the men in camps at 750 different points, camps, and cantonments in America, more than 2500 secretaries to serve, not only the men from the United States now in France, but also to extend the similar association service to men in the French and Italian armies as well. The association work in the army and navy is increasing with almost incredible rapidity.

**YOUNG WOMEN'S CHRISTIAN ASSOCIATION.** The Young Women's Christian Associations in the United States are united through the agency of a national board, which has its headquarters at 600 Lexington Ave., New York City. Through this board the associations participate in the work of the World's Young Women's Christian Association. In addition to supervising local associations through eleven field committees, a staff of 135 headquarters and field secretaries promote such specialized activities as: Visiting and teaching immigrant women and girls; benefiting farm girls through county associations; helping young business women by vocational guidance; summer camps, etc.; establishing clubhouses for nurses and art students; offering opportunities to Indian and colored students; and interesting leisured women and college alumnae in philanthropic and religious work. Through a staff of 67 American secretaries abroad, the board extends its work to India, China, Japan, South America, and Turkey. In 1917, provision was made for 18 city, student, and county conferences, 6 industrial and 3 high school councils, in which 7202 young women were given ten days of rest, recreation, and religious instruction.

Immediately following the entry of the United States into the war the Young Women's Christian Association appointed a war council, and entered upon an active campaign in the interests of girls and women in the war. Features of this work are the erection of hostess houses in the army camps throughout the country; emergency housing for girls employed in military and industrial centres; a Patriotic League for younger girls; club and recreation centres for colored and white women; work with foreign-born women in the United States and a bureau of social morality speakers; enrolling over 100 prominent physicians; the institution of industrial clubs for the women of France and Russia; and the organization of social centres for American nurses in France. A war fund of \$5,000,000 was raised in 1917-18.

**YUKON.** A territory of Canada. It is bounded by Alaska on the west and the Northwest Territories on the east, and extends from British Columbia, at the 60th parallel, to the Arctic Ocean. The estimated area is 206,427 miles, of which 649 water. The population at the 1911 census was 8512, as compared with 27,219 in 1901. The capital is Dawson; it had 9142 inhabitants in 1901 and 3013 in 1911. Yukon is governed by a commissioner and a legislative council of 10 members elected for three years. Commissioner, George Norris Williams, appointed September 25, 1915.

**ZAMENHOF, LUDWIG.** A Russian philologist, inventor of Esperanto, died in Warsaw, April 15, 1917; born in Bielostok in 1856. His first communication on the subject of an international language was signed "Dr. Esperanto,"

that is "Dr. Hopeful," and from this came the name. His proposals in general were so reasonable and simple that the new language attracted many adherents, who hoped chiefly that it would result in a better understanding among nations and so in the attainment of world peace. Esperanto succeeded Volapük in its field, and, while it has met much opposition, it has demonstrated the possibilities for an auxiliary international tongue. Dr. Zamenhof visited the United States in 1910 to attend an Esperanto Congress.

**ZANZIBAR.** A British insular protectorate off the coast of German East Africa. It consists of Zanzibar Island (640 square miles), Pemba Island (380 square miles), and several islets. Population, about 199,000, mostly Mohammedan.

**ZEPPELIN, FREDERICK A. A. H., Count von.** A German soldier and airship builder, died at Charlottenburg, Prussia, March 8, 1917. He was born July 8, 1838, on an island in the Lake of Constance. His father, Count Friedrich von Zeppelin, was a Württemberg court official and his mother was descended from an old French refugee family. He studied at the Stuttgart Polytechnicum, the Ludwigsburg Military Academy, and the University of Tübingen, and entered eagerly upon the life of a soldier. With the rank of lieutenant, Count Zeppelin was sent to the United States in 1863 to be a military observer on the Union side in the Civil War, and he served with the Army of the Potomac. His first balloon ascension, made at St. Paul, Minn., convinced him of the importance of aircraft in war, for scouting purposes. After his return, he fought for Württemberg against Prussia in the Seven Weeks' War of 1866, and, in 1870-71, he distinguished himself in the Franco-Prussian War, on the Prussian side. He was one of a group of young officers who crossed the boundary shortly after war was declared and, eluding the patrols, penetrated far into Alsace. They were surprised by the enemy, but Zeppelin escaped with important information. Later he became plenipotentiary of Württemberg at Berlin, and representative in the federal council of the empire. At 53, as lieutenant general, he retired to devote himself wholly to what had been his hobby for some years, the construction of a large dirigible balloon.

It was almost 20 years later that, after failures enough to have discouraged most men, he was hailed by the kaiser as "the greatest German of the twentieth century." He made himself a mechanical expert so as to be able to carry out his plans, and neither technical difficulties, catastrophes, the gradual diminution of his personal fortune, nor ridicule could stop him. Long before Germany was ready to give him encouragement, governments of other nations tried to secure his services, but he preferred to save his talents for the Fatherland. At last he was reduced to living in a small cottage, and to dependence on loyal friends for his support. In most quarters he was regarded as a "crank." In 1900 he was enabled to make his first ascent from Friedrichshafen with the type of airship which has since been associated with his name—a great cigar-shaped frame of rigid construction, enclosing some 17 balloon compartments filled with hydrogen gas, steering rudders, and a suspended gondola containing the motors, with space for operators and passengers. A French-

man has been credited with inventing the rigid frame, but Zeppelin gave it successful embodiment, and eventually the Germans were about the only champions of this type of construction. The first Zeppelin was wrecked on its third trial in descending to its harbor on Lake Constance, and much the same fate happened to one after another of its successors. Each disaster was credited to a different cause, but sudden gusts of wind did most damage to the unwieldy craft. Up to the beginning of 1914, 13 Zeppelins had been destroyed. In 1908, during a government test, after traveling 380 miles within less than 24 hours, and with only 70 miles to go, the machine had to descend for repairs and suddenly caught fire and was destroyed. At that time each such loss represented some \$500,000. The people came to the inventor's rescue with a popular subscription that brought him three times that sum. The next Zeppelin covered 690 miles in 38 hours, and in 1909 a trip of 1000 miles was made.

The "L-I," the first naval Zeppelin, 525 feet long, 50 feet in diameter, and with a speed of 52 miles an hour, was launched in 1912 and taken, by the count from Friedrichshafen to Johannisthal in 32 hours. It was the first to carry wireless equipment. On a later trip, in 1913, it was destroyed off Heligoland with a loss of 15 lives. The "L-II" exploded 900 feet above the Johannisthal aviation field, killing 27 men, among them several prominent naval officers. Despite foreign criticism of the Zeppelin as a mechanical monstrosity, the German government and people clung to their faith in it. Before the European War there were airship harbors in many German cities, and the chief shops at Friedrichshafen, capable of producing two or three machines a month, were supplemented by great factories elsewhere. During the war the Zeppelins were used chiefly for raids, such as those on the English towns. To meet enemy aeroplanes, the Germans found they had to have aeroplanes themselves. The failure of his airships as engines of war is said to have grieved Count Zeppelin greatly. Thirty-nine of them were reported destroyed in battle up to May 15, 1917. Zeppelin trained his son as a builder of dirigibles, and his daughter also became a skillful aeronaut. His wife was a Russian baroness, Isabella von Wolff, who came from the German-speaking province of Livonia. Consult F. A. Talbot, *Aeroplanes and Dirigibles of War* (London, 1915), and R. P. Hearne, *Zeppelins and Super-Zeppelins* (New York, 1916).

**ZEPPELIN AIRSHIP.** See **AERONAUTICS**; **MILITARY PROGRESS.**

**ZINC.** The zinc-mining and zinc-smelting industries started the year 1917 with every prospect of prosperity, although the price of spelter was below the average of the preceding year. During the last half of the year both the zinc smelters and zinc miners were claiming that their operations were unprofitable because of the high general prices and the low price of spelter. In consequence, a large part of the smelting capacity of the country was idle at the close of the year and there was a notable curtailment of output during the last quarter. According to the best information available, the recoverable zinc content of ore mined in the United States in 1917 was about 690,000 short tons, compared with 702,610 tons in 1916, and 605,915 tons in 1915.

The production of spelter from domestic ore in 1917 is estimated at 574,994 short tons, worth, at the average St. Louis spot quotation, about \$102,350,000, and the production from foreign ore at 92,757 tons, a total of 667,751 tons, worth \$118,860,000, compared to a total of 667,456 tons in 1916, worth \$178,878,000, at the average St. Louis selling price. This indicated practically the same production as in 1916, but a loss of more than \$60,000,000 in value. Included in the output is 28,175 tons of electrolytic spelter, of which a part was refined by electrolysis from prime western spelter. This was the product of five plants. The quantity of zinc dust prepared for market was over 7000 tons. The output of secondary spelter redistilled at regular smelters and at the smelters with large retorts was about 21,600 tons.

Primary spelter was produced during the first half of the year at the rate of 722,000 tons a year, during the third quarter at the rate of 626,000 tons a year, and during the fourth quarter at the rate of 600,000 tons a year.

**IMPORTS AND EXPORTS.** The imports of spelter (mostly scrap) are estimated at 270 short tons, valued at about \$25,000, compared with 684 tons in 1916. Zinc dust was imported to the amount of 380 tons, worth \$90,000. The imports of zinc ore in 1917 were approximately 215,000 short tons, containing about 75,600 tons of zinc and worth about \$4,550,000, compared with 385,964 tons of ore, containing 148,147 tons of zinc, in 1916. The exports of spelter and sheets made from domestic ore are estimated at 144,000 short tons, worth \$37,000,000, compared with 163,137 tons, worth \$51,312,990, in 1916. The exports of spelter made from foreign ore are estimated at 60,000, valued at \$11,900,000, compared with 43,230 tons in 1916. The exports of zinc manufactures fell off to \$400,000 in 1917 from \$572,286 in 1916. The exports of brass are estimated at 169,000 tons, valued at \$104,300,000, compared with 122,466 tons, worth \$72,683,626, in 1916. Manufactures of brass were exported to the value of about \$134,500,000, compared with \$241,668,081 in 1916. The value of loaded cartridges exported in 1917 was about \$41,000,000, against \$55,103,904 in 1916.

**ZIONISM.** See **JEWS AND JUDAISM.**

**ZOOLOGY.** The war seemed not to have interfered in any way with zoological research in America, and the usual number of papers along anatomical and experimental lines were published. Publications in France and England were somewhat fewer than usual, while the standard zoological journals from Germany did not reach the United States at all. In the summary here given, only results of general interest are mentioned, and the files of the various journals should be consulted for the more technical papers. The American Society of Zoologists and the American Association for the Advancement of Science with its section for zoology met during the Christmas holidays in Minneapolis and in Pittsburgh respectively.

**EVOLUTION.** Osborn in *The Origin and Evolution of Life* developed an "energy concept" of evolution. "The evolution of life may be rewritten in terms of invisible energy as it has long been written in terms of visible force." "In each organism the phenomena of life represent the action, reaction, and interaction of four complexes of physico-chemical energy, viz.

(1) the inorganic environment; (2) the developing organism; (3) the germ or heredity chromatin; (4) the life environment. His central theory is that every physico-chemical action and reaction concerned in the transformation, conservation, and dissipation of energy produces also a physico-chemical agent of interaction which permeates and more or less affects the organism as a whole. Groups of tissues and organs are one after the other brought into existence for the capture, storage, and transformation of energy. The hormones are the agents in interactions within the organism. Selection operates only after structures appear.

The *mutationists* state that evolution is never through the accumulation of slight steps, but through the sudden appearance of variations which are discontinuous with anything which preceded them; the *selectionists* claim that by selection of slight variations considerable end differences may result. Jennings, quoting from the results of work on *Drosophila* (see YEAR BOOK for 1915 and 1916), showed that even the most extreme believers in the mutation theory have given evidence in favor of the opposite theory. Bridge's work on the eye color of *Drosophila* has shown that seven color gradations exist between white and red, and in the case of one of these, seven modifying factors for one color. These, Jennings argued, are really the alterations in the hereditary constitution which the selectionist demands, and thus the real distinction between the two schools disappears. Morgan, in reply to Jennings, admitted that some mutations are so small in amount as to appear like fluctuations, but claimed that such extreme variations as from red to white (which may appear in one generation) show that mutations do occur and that the other changes are really mutations differing only in degree from the first.

Osborn and others have claimed that paleontological evidence indicates that evolution has been in one direct line, and not by the selection of certain variations instead of others. Jennings showed that certain so-called "varieties" described by Osborn as merely non-heritable modifications are really what we would find if there had been indefinite variation, and that so far as this goes the paleontological evidence does not negative the idea of evolution through selection of favorable variations.

Crampton published the first volume of an elaborate *Study on the Variation, Distribution, and Evolution of the Genus Partula on the Island of Tahiti*, giving a statistical treatment of the subject in such form as to be valuable for a later discussion of the evolution of this group.

In evolutionary discussions, much use has been made of the process of artificial selection by breeders as bearing on the question of natural selection. Pearl, in his address as president of the American Society of Naturalists, stated that when practical breeders use the term selection, they really mean an elaborate process of crossing of varieties and combinations of old characters so that there is here no real selection. He was skeptical as to the value of selection, since it is always based on somatic characters and may not select the best germ plasma, which is the really important substance in evolution.

Lotay argued that evolution is always by

means of hybridization. Variations come in only through crossing, and this is true for extinct as well as for recent forms. He did not make clear how the divergent varieties first came into existence.

HEREDITY. In the YEAR BOOK for 1915 was mentioned a crossing over theory to explain certain observed facts in the heredity of *Drosophila*, this being dependent on the reality of the "chiasma type" of the synopsis of the chromosomes. The fact that this type does not occur in all cases where the crossing over appears was made the basis of a criticism of the crossing over theory and Goldschmidt attempted to show that the assumption of certain "forces" which are connected with chromosomes, perhaps absorbed by them, and which are quantitatively variable, is sufficient to explain crossing over without recourse to the chiasma type. These forces he suggested might be of the nature of enzymes. Sturtevant, whose earlier papers were made the basis of Goldschmidt's criticism, claimed in reply, that Goldschmidt had not taken into consideration later papers in which some earlier difficulties had been cleared up, and that Goldschmidt's theoretical illustrations on which he based his argument, did not really accord with the facts.

Work on heredity in mice has thus far failed to produce a homozygous yellow mouse, and Kirkhan reported the discovery of disintegrating embryos in mice, indicating that something connected with the factor for yellow prevented the development of the individual. Little, citing this observation, pointed out that it indicated that the effect of the yellow factor (if this explanation is correct) is shown long before any color appears, so that the factor may have different functions at different stages in the ontogeny. A similar condition exists in a "black-eyed white" factor. Ibsen and Steigleder studied further this yellow-yellow mating in mice. They gave evidence to show that the homozygous yellow gametes are really formed, but that they fail to develop normally after implantation. They suggest that possibly a lethal factor such as has been described in *Drosophila*, may also exist here.

Davenport reported observations on the heredity of stature in man, which indicated that variations may arise through differences in the time of puberty, this seeming to exercise an inhibiting effect on growth. Offspring of tall parents are less variable and show less tendency to revert to mediocrity than when the parents are below mediocrity. It is possible that the factors for tallness are recessive.

Foot and Strobell studied inheritance of the form of the intermittent organ in the insects *Euschistus variolarius* and *E. icterus* with especial reference to the chromosomal theory of heredity. They got no evidence for a Mendelian form of inheritance in these animals, and from this drew the conclusion that there is no evidence for a transmission of sex or other characters through definite chromosomes, as has been claimed by Wilson, Morgan, and their students.

Hargitt studied the formation of sex cells in a medusa, *Hybocodon*, where several generations of medusae formed by budding may intervene between two sexually produced ones, and was unable to find any trace of a contin-

uity of the germ cell material, as was assumed by Weismann in his theories of heredity.

In the YEAR BOOK for 1916 were given results obtained by Stockard with guinea pigs, which indicated that the effect of alcoholic poisoning were very markedly injurious to later generations. Pearl conducted similar experiments on fowls, and found that no especially injurious results could be detected. There was a decrease in the fertility, but on the other hand, an increase in the vigor of the offspring actually produced. Nice found that mice do not show that they are affected injuriously by alcohol. He suggests that this resistance may be correlated with their well known lack of susceptibility to disease germs.

GENERAL. Harvey studied the chemistry of light production in a number of animals and in bacteria. In most cases he thought he could isolate from the luminous material two substances to which he gave the name *photogenin* and *photophelin*, the former being a colloid and the latter a crystalloid. Luminescence is the product of the action of one of these on the other, the process being something like an enzyme action, but differing in that both substances are used up in the process. In *Cypridina*, a crustacean, he found that photogenin is formed in a special gland, while the other compound may occur in other parts of the body or in other organisms as well. In a number of cases he was not able to separate these substances, but thought that this was because the two were present in equivalent amounts. DuBois, who had earlier used the terms *luciferine* and *luciferase* for the components of luminescent compounds, stated that in adopting his general theory with a change of nomenclature Harvey had not fully understood his position.

Laurens studied the reactions of the melanophores in the skin of amphibian larvae, both those that could see and those that were blinded. The reactions are alike in the two, the melanophores expanding in the light and contracting in the dark. Normal animals kept for three to five days in either light or darkness gave the opposite result, indicating that long-continued stimuli on the nervous system through the retina caused a reversal of the reaction. This reversal did not occur in blinded larvae. Laurens could not discover that the parietal organ governs in any way the melanophores, but McCord and Allen found that feeding parietal organ tissue to tadpoles was followed by a very decided lightening of the whole animal. An acetone solution of this parietal material will, if injected into the body, or even if absorbed by the gills, give the same result.

Laurens stated that the general function of the melanophores is to contract in darkness and expand in the light, but that under the influence of the nervous system, due to environmental conditions, psychic factors, etc., the opposite results may follow. The reaction is probably an adaptive one, though the subject is complicated by the fact that the melanophores of different animals do not react in the same way. Cole and Dean found that the tadpoles of a species of frog would respond definitely to light stimulation, the skin of the tail being the most sensitive part. They thought that this is a response to a nerve stimulation, and

not a direct response to the light reaching the melanophores.

A perennial question in zoölogy is the meaning of the coloration of animals, especially concerning the significance of brilliant colors. These have been called "warning" where they are associated with distasteful or unpleasant characters, and Reighard (see YEAR BOOK for 1909, article BIOLOGY) has applied the term "immunity coloration" for cases like the reef fishes of the tropics, where brilliant coloration is not associated with any such unpleasant features. He supposed that being protected by their mode of life among the rocks the fishes who chanced to develop bright colors would not be eliminated by their enemies, and thus the brilliant colors would be preserved. The subject has been re-investigated by Longley, who worked in the same locality as did Reighard, and who has decided as a result of several years of observation on the reef fishes, that they are really protected by their colors, which appear so conspicuous when the animal is taken from its natural environment. Observations made by the help of a diving helmet where the observer is at a level with the fishes show that to the human eye, and presumably to the eye of the fish the colors really blend with the background. Longley found that many fish are countershaded and thus protected in the manner emphasized by Thayer (see YEAR BOOK for 1909, article BIOLOGY), and especially defended types are not unlike others in pigmentation. All of these fish have more or less ability to change color under different environments, and the red fishes which would be so very conspicuous in the daylight remain hidden at this time, coming out only at night, when this color blends perfectly with their background. These observations lend no support to theories of warning and immunity coloration, nor to sexual selection, signal, and recognition marks. His conclusion was that natural selection was the only explanation which can be offered for these colors. On the other hand, Crozier, working in Bermuda with the brilliantly colored nudibranch, *Chromodoris*, determined that the animal was protected by an unpleasant taste and odor, the latter seeming to act as a repellent when the animal was enclosed in a bag and thus its colors made invisible. This, he decided, supports the immunity coloration explanation for the origin of the colors.

Another perennial problem in zoölogy is the time and method of sex determination in the developing embryo. In some insects it seems to be definitely proved that the sex is determined at the time of fertilization of the egg, for fertilized eggs develop into females, unfertilized ones into males. Similar conclusions follow from the conditions in insects where one egg develops into many larvae, these usually being all of the same sex. Patterson, however, has described the conditions existing in *Parecopidosomopsis*, an insect whose young are parasitic on the egg of the cabbage butterfly *Autographa brassicae*. Here the number of mixed broods, containing, that is, both males and females, is greater than the number of single sexed ones. Since the count was made from the number of the parasitic insects which emerge from the host, it might be that more than one egg had been laid in it, but Patterson thought this explanation was inadequate. His final ex-

planation was based on the possibility of a non-disjunction of the sex chromosomes (see YEAR BOOK for 1916) in such a way that the X chromosomes which are the sex determiners are not "disjoined" during the cleavage stages. Thus, either males or females might appear. Further evidence for this conclusion is that in some cases asexual larvae appear, indicating that the X chromosome had been lost entirely in their formation.

Goldschmidt, as a result of work on gypsy moths, thinks that there are two factors involved in sex determination, working simultaneously and independently in each sex, one carried in the sex chromosome, the other inherited maternally, probably carried in the cytoplasm of the egg. Certain crosses of the gypsy moth give a complete series of individuals showing all possible gradations of structure from the male to the female condition. He concluded that the observations could be explained on the assumption of two enzymes *gynase* and *andrase* which would, if working alone, give rise to female and male individuals respectively. Both are present in the fertilized egg, the gynase being in such constant concentration that it is higher than one portion of andrase and lower than two. If the former condition holds, a female results and if the latter a male. Where intersexuality occurs it means that one of these enzymes has become exhausted in the production of a certain organ, and that then the effects of the other become manifest. Thus a gradation between male and female conditions occurs. The first formed organs will thus be of one sex, while later ones will be of the other. He thinks that these enzymes are attached to—adsorbed by—the chromosomes, and that this fact explains the rôle of the chromosomes in sex heredity.

Whitney had stated that the feeding of rotifers with green algae would increase the number of male producing females, but his conclusions were combated by Shull (see YEAR BOOK for 1916), who thought that the effect would follow on the increased production of oxygen in the water formed by the alga and not on the alga itself as food. Whitney repeated his experiments and showed that the same result follows if the animals are kept in the dark while feeding with the alga, thus where no oxygen can be given off. He admits that oxygen may affect the female, causing her to produce male producing offspring, but thinks that where this occurs it is an indirect effect, working through the development of bacteria and protozoa and not any direct effect of the oxygen.

In *Crepidula*, which is a protandric hermaphrodite, Gould stated that the assumption of the male condition is dependent on external factors. If the larva settles where there is no larger individual, it does not assume the male phase, but it will do so if there is a larger individual near, and this may be either male or female. Neither movement nor feeding furnishes the stimulus for male development, which seems to be entirely dependent on the presence of a larger individual. No cause for this result was given, though it was shown to be of advantage to the race, for since the male changes into the female phase as soon as the female is fertilized, this insures that there will always be a male ready to fertilize the female, and that as soon as the fertilization is accomplished

the individual changes into an egg producing female.

The question of the mechanism of sex differentiation in mammals was attacked by Lillie in a study of the "free martin" in cattle. This is a condition where twin offspring of different sexes are born, and in such cases it usually happens that the female is sterile. Lillie's observations led to the conclusion that these two embryos came from different ova, and that each independently forms an embryonic chorion. Later there is, in many cases, a complete anastomosis of the blood vessels of the two chorions, as was demonstrated by injecting the arteries and veins, when it appeared that either could be injected from the other. The testes of the male individual develop earlier than the ovaries of the female, and Lillie concluded that hormones arising in these developing testes react in such a way on the organs of the other individual that although the external sexual features are female, the internal female structures do not develop, the embryonic tissue which would form them differentiating along male lines. The general surface similarity to male organs was confirmed by a histological study of these organs, made by Chapin. Lillie showed that this sterility does not occur in sheep, where observation showed that there is no anastomosis between the blood vessels of the twins.

Riddle (see YEAR BOOK for 1916) repeated his conviction that while a definite chromosomal composition accompanies sex determination, it is only a sign or index, sex determination being entirely a matter of metabolism. Femaleness in the egg is marked by low metabolism, lower per cent of water, and higher total fat and phosphorus, maleness being accompanied by exactly the opposite of each of these. These distinctions in the egg are carried into the adult, and he thinks that he gets evidence for this latter statement from analyses of blood especially in fowls and man, where the above mentioned sex differences appear, and in researches by Benedict and Emmes which demonstrate that the metabolism is 5 to 6 per cent greater in man than in woman. The experiments of Goldschmidt (see above) show that it is possible to get sex intergrades, and these are hard to explain on any Mendelian theory, but easy to understand if sex is determined by metabolism. In Riddle's opinion, any influence acting on the young animal in such a way as to modify its metabolism will produce a corresponding change of sex.

Observations by Shull seemed to indicate that the manner of sex determination may vary in closely related animals. In the insect *Anthothrips verbasci*, conditions seem to be very like those of the bee, where an egg is male or female, according to whether it is unfertilized or fertilized. In *Thrips tabaci* and in *Anaphothrips striatus* males are often very rare, which is difficult to explain on the above hypothesis, for if absent at one egg laying all of the eggs would develop into males, and thus these would be abundant in the next generation, but since this does not occur, the males must arise as in aphids, probably through some maturation changes.

Schaeffer continued experiments on the reactions of *Amoeba* (see YEAR BOOK for 1916). He decided that *Amoeba* will respond to (will "sense") beams of light 20 microns in diame-

ter at a distance of 100 to 150 microns, and that it will also "sense" beams of darkness before it comes very near them. It usually avoids the latter stimulus, though it may be a positive, negative, or indifferent in its reactions according to circumstances. Amœba will respond to stimuli reaching it from albumens in the water, though he thought that this response was due to stimuli coming from soluble impurities in the albumens. If absolutely insoluble, proteids might not be injected. Whenever possible, an amœba will utilize the remains of an old pseudopodium rather than form a new one. Mast, working on *Didinium*, came to the conclusion that in these animals encystment is not followed by an increase in the rate of fission, seeming rather to be due to unfavorable environmental conditions. Neither could he discover that conjugation had any appreciable effect on the death rate, the fission rate, or any variation in the latter rate, thus leading to the conclusion that neither conjugation nor encystment has any rejuvenating effect. Animals about to conjugate tend to aggregate, this probably being due to some chemical reactions set up by the aggregating individuals.

Woodruff and Erdmann (see YEAR BOOKS for 1914 and 1916) described as "endomixis" a process of nuclear reconstructions in *Paramœcium*. To meet the criticism that this might have been due to long continued cultivation under laboratory conditions, they have observed material from various localities, collecting from Germany, from Ohio, and from Woods Hole and Williams-town in Massachusetts. In all of these specimens the same phenomenon could be seen. Hadley continued his studies on *Trichomonas* which has been identified as the cause of the disease "blackhead" in turkeys. This normally occurs in the intestine of the animals as a commensal, but under certain conditions it may penetrate the wall of the intestine, causing fatal lesions not only in the wall of the intestine but in the liver as well. The parasite is not affected by being swallowed by phagocytes, but carries on normal reproductive processes inside these cells. There are apparently two different forms, but Hadley thought these were merely two different phases dependent on food conditions. Since the parasite is always in the intestine legislation intended to prevent the spread of the disease has little value. Infection is caused by individuals of the commensal passing from the intestine and being taken up by other birds.

Hance reported the discovery of a race of *Paramœcium* with two contractile vacuoles. Vorhies announced the discovery of *Amœba* and some ciliates in Great Salt Lake, Utah, this being the first time these animals have been reported from brine lakes. Parker described the locomotion of actinians. This is produced by a continuous creep something like the movement of gasteropods, caused by a contraction wave passing over the foot. There is usually only one wave, but there may be more. There is in addition a slimy secretion which holds the animal to the substratum. The direction of this locomotion has no reference to the axes of the body. Cary showed that in the coral reefs of Samoa the gorgonian corals are more important than the stony in reef production, and observations by Mayer in the same locality showed that land waters do not have a solvent

effect on coral rock, as was inferred in the solution theories of atoll formation.

Wulzen described the reaction of Planarians to meat juices. There is a double response in this case, one by the pharynx and one by the whole animal, the latter under usual conditions acting as an inhibitor of the former. If the anterior region of the body be cut away the pharynx reaction is more pronounced and a pharynx removed from the body will react to food in a normal fashion.

Crozier found that the land nemertean, *Geonemertes*, in Bermuda, occurs in the water down to below low water mark, and decided that its habits indicate that the land nemerteans are descended from salt water forms. Cobb described a new nematode, *Tylenchus penetrans*, which infests the roots of a number of plants, the most important economically being the potato, where it attacks the tuber. It is a dangerous parasite, for it cannot easily be killed even by immersion in corrosive sublimate, and once in the soil will attach itself to other plant roots, thus making eradication impossible. Stewart stated that *Aecaris lumbricoides* is a very dangerous parasite of man in Hong Kong, the intermediate host being rats or mice. From the intestine of the rodent they pass into the liver, from here into blood vessels, and are found in the bronchi on the seventh day after infection. From here they get to the food of man. Rabaud reported to the French Academy that experiments on stinging hymenoptera showed that when they sting other insects they do not necessarily pierce a ganglion. Also he saw one stinging spider and in this case the sting was inserted near the end of the abdomen, thus a long way from the ganglion. Paralysis and death followed, however, in characteristic fashion. Lecaillon found "accidental" bivoltins in an unvolutin race of silkworms, and thought he could detect chemical differences between the eggs of the two races. He thought that environmental conditions tend to exaggerate these differences and thus bring on bivoltinism. He also found in silk worms that both sexes develop from parthenogenetic eggs. Boulenger found in the mouth of a fish, *Barbus*, from Lake Tanyanika, a series of little tooth-like prominences developed in the ectoderm, which are apparently similar to ectodermal thickenings found on other parts of the body of other fish. They appear only in the male and at the breeding season. Their position in the mouth is, however, unique. D'Arcy Thompson found that *Chimara monstrosa* spawns off the Norwegian coast in winter and in deep water in warmer weather. Mrs. Wilder reported that in the amphibian *Desmognathus fusca* the incubation period apparently depends on temperature, but lasted in one lot about eight weeks. The internal fertilization of the eggs and their protection by the mother insures that a relatively high proportion of individuals reach maturity. The expedition of the American Museum of Natural History to Nicaragua secured 1500 fishes and 2000 reptiles. This is of especial interest as being the first reptile collection made from this locality.

Oecological studies made at the University of Illinois indicated that the distribution of the ground living mammals as e. g. the white footed rat, is determined by the rate of evaporation, and therefore the moisture, while in California Grinnell thought that temperature is the most

important, though not the sole factor. Hegner described a "singing mouse" caught at Ann Arbor, Mich. The song was described as a rapid whole toned trill involving the notes c and d. Earlier explanations of this phenomenon supposed that it was due either to pregnancy or to disease, but Hegner was unable to discover that either explanation would apply in this case.

Hornaday reported that the largest collection

of rare species of mammals, birds, and reptiles that ever came to America was brought in in July, some having been bought by the New York Zoölogical Society and some by the Philadelphia Society. The animals were collected in Australia. See also ORNITHOLOGY; ENTOMOLOGY; FISH AND FISHERIES.
